

Ultra High Precision Foil Wraparound Surface Mount Chip Resistor with Extended Pads for High Power/High Temperature Applications up to +225°C, Load Life Stability of 0.05% ,TCR to ± 1ppm/°C

INTRODUCTION

Vishay Foil Resistors (VFR) introduces a new line of Ultra Precision Bulk Metal® Z1-Foil technology: wraparound surface mount chip resistors with extended pads for high temperature up to + 225 °C⁽¹⁾ (working power: to 330mW at +200 °C).

The new extended pad designs also exhibit better heat dissipation, thus enabling higher power usage (Working Power: to 1200mW at + 70°C ⁽¹⁾). The FRSH has a full wraparound termination that ensures safe handling during the manufacturing process, as well as providing stability during multiple thermal cyclings.

The FRSH is available in any value within the specified resistance range. VFR's application engineering department is available to advise and make recommendations. For non-standard technical requirements and special applications, please contact foil@vishaypg.com.

TABLE 1 - TOLERANCE AND TCR VS. RESISTANCE VALUE (1)(2)
(- 55 °C to + 200 °C, + 25 °C Ref.)

RESISTANCE VALUE (Ω)	TOLERANCE (%)	TCR Typical (ppm/°C)
250 to 125K	± 0.02	±2.5
100 to < 250	± 0.05	
50 to < 100	± 0.1	
25 to < 50	± 0.25	
10 to < 25	± 0.5	

Note

- (1) Performances obtained with ceramic PCB.
- (2) For tighter performances and non-standard values up to 150 kΩ, please contact VFR's application engineering department by sending an e-mail to the address in the footer below.

FEATURES

- Temperature coefficient of resistance (TCR): ±1 ppm/°C typical (- 55 °C to + 125 °C, + 25 °C ref.) ±2.5 ppm/°C typical (- 55 °C to + 200 °C, + 25 °C ref.)
- Resistance range: 10 Ω to 125 kΩ (for higher and lower values, please contact VFR's application engineering department)
- Resistance tolerance: to ± 0.02 %
- Working power⁽¹⁾: to 1200mW at + 70 °C; to 330mW at + 200 °C
- Long term stability: to ± 0.05 % at + 225 °C for 2000h, no power
- Load life stability: to ± 0.05 % at + 200 °C for 2000h, at working power
- Vishay Foil resistors are not restricted to standard values; specific "as required" values can be supplied at no extra cost or delivery (e.g. 1K2345 vs. 1K)
- Thermal stabilization time < 1 s (nominal value achieved within 10 ppm of steady state value)
- Electrostatic discharge (ESD) at least to 25 kV
- Non inductive, non capacitive design
- Rise time: 1 ns effectively no ringing
- Current noise: 0.010 μV (RMS)/Volt of applied voltage (< - 40 dB)
- Voltage coefficient: < 0.1 ppm/V
- Non inductive: < 0.08 μH
- Non hot spot design
- Terminal finishes available: High Temperature solder - Solidus temperature: +236°C Liquidus temperature: +244°C
- Matched sets are available on request
- Prototype quantities available in just 5 working days or sooner. For more information, please contact foil@vishaypg.com

FIGURE 1 - POWER DERATING CURVE

HIGH TEMPERATURE PRODUCTS

Resistors are the passive building blocks of an electrical circuit. They may be used for dropping the voltage, buffering the surge when the circuit is turned on, providing feedback in a monitoring loop, sensing current flow, etc. When the application requires stability over time and load, initial accuracy, minimal change with temperature for more than 200 °C, resistance to moisture and a number of other characteristics that will be described below, only the new generation of Vishay Foil Resistors have the attributes needed for such application. Over the past few months, there has been considerable growth in the demand for precise, stable and reliable resistors that can operate in harsh environments and especially at high temperatures to 220 °C. Many analog circuits for industrial, military, aerospace, medical, down-hole, oil well and automotive applications require passive components such as resistors to have a minimal drift from their initial values when operating above + 175 °C and in humid environments. In these applications, the most important factor is the temperature dependence and the end of life tolerance (which is part of the stability) and to a lesser extent, the initial tolerance.

The new Vishay Foil resistors provide stabilities well under the maximum allowable drift required by customers' specifications through thousands of hours of operation under harsh conditions, such as the extreme temperatures and radiation-rich environments of down-hole oil-well logging applications, in the frigid arctic, under the sea or in deep space. All Bulk Metal[®] Foil resistors receive stabilization processing, such as repetitive short term power overloads, to assure reliable service through the unpredictable stresses of extreme operation. Compared to Bulk Metal[®] Foil, thick and thin film resistor elements are produced with a non-controllable material. Heat or mechanical stresses on the resistive elements cause the particles forming the film to expand. However, after these stresses are alleviated, the particles in the film matrix do not return to the exact original position. That degenerates their overall stability.

Vishay Foil Resistors' Ultra High Precision Bulk Metal[®] Foil technology includes many types of resistors with a variety of standard configurations that can withstand unconventional environmental conditions above and below the earth's surface using special post manufacturing operations specially developed for this purpose. The stability of a resistor depends primarily on its history of exposures to high temperature. Stability is affected by:

1. Changes in the ambient temperature and heat from adjacent components (defined by the Temperature Coefficient of Resistance, or TCR)
2. Destabilizing thermal shock of suddenly-applied power (defined by the Power Coefficient of Resistance, or PCR)
3. Long-term exposure to applied power (load-life stability)
4. Repetitive stresses from being switched on and off

In very high-precision resistors that need to operate in an environment with temperatures above + 175 °C, these effects must be taken into account to achieve high stability with changes in load (Joule Effect) and ambient temperature.

The Bulk Metal[®] Foil Resistors' new Z1-Foil technology provides an order of magnitude reduction in the Bulk Metal[®] Foil element's sensitivity to temperature changes — both external and internal – with emphasis on long term stability in high temperature environments.

In order to take full advantage of the low TCR and long term stability improvement, it is necessary to take into account the differences in the resistor's response to each of the above-mentioned effects. As described below, new products have been developed to successfully deal with these factors. For high temperature applications where stability and total error budget is the main concern, the new generation of Vishay Foil resistors offers the best resilience against time at elevated temperature.

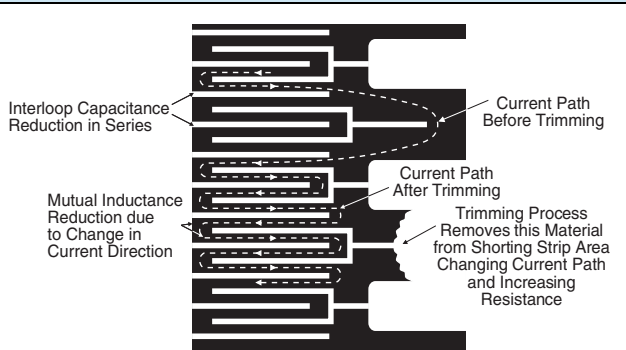

The new Vishay Foil technology allows us to produce customer-oriented products designed to satisfy unique and specific technical requirements. In addition to the special chip stabilization under extreme environment conditions in the production line, we offer additional specially oriented post manufacturing operations (PMO) for high temperature applications that require an even higher degree of reliability and stability.

Electrostatic Discharge (ESD) is another potential problem that can cause unpredictable failure in high temperature applications that increase the sensitivity of the resistors to ESD.

ESD damage to electronic devices can occur at any point in the device's life cycle, from manufacturing to field service. A resistor that is exposed to an ESD event may fail immediately or may experience a latent defect. With latent defects, premature failure can occur after the resistor is already functioning in the finished product after an unpredictable length of service. Bulk Metal[®] Foil resistors are capable of withstanding electrostatic discharges at least to 25 kV without degradation.

VFR's Application Engineering department is always available to assist with any special requirements you might have. If you are not sure which resistor best suits your needs, please do not hesitate to contact them for more information: Foil@vishaypg.com

FIGURE 2 - TRIMMING TO VALUES
(Conceptual Illustration)

Note: Foil shown in black, etched spaces in white

To acquire a precision resistance value, the Bulk Metal® Foil chip is trimmed by selectively removing built-in “shorting bars.” To increase the resistance in known increments, marked areas are cut, producing progressively smaller increases in resistance. This method reduces the effect of “hot spots” and improves the long term stability of the Vishay Foil chips.

TABLE 4 - SPECIFICATIONS⁽¹⁾

CHIP SIZE	RATED POWER (mW) at + 70°C	WORKING POWER (mW) at + 200 °C*	RESISTANCE RANGE (Ω)
0603	120	33	100 to 5K
0805	300	83	10 to 8K
1206	500	140	10 to 25K
1506	600	167	10 to 30K
2010	800	220	10 to 70K
2512	1200	330	10 to 125K

Note

* Maximum working voltage for a given resistance value is calculated using $V = \sqrt{P \times R}$.

TABLE 2- DIMENSIONS AND LAND PATTERN in Inches (Millimeters)

CHIP SIZE	L ± 0.005 (0.13)	W ± 0.005 (0.13)	THICKNESS MAXIMUM	D ± 0.005 (0.13)	Z	G	X
0603	0.063 (1.60)	0.032 (0.81)	0.025 (0.64)	0.011 (0.28)	0.102 (2.59)	0.031 (0.78)	0.031 (0.78)
0805	0.080 (2.03)	0.050 (1.27)	0.025 (0.64)	0.015 (0.38)	0.122 (3.10)	0.028 (0.71)	0.050 (1.27)
1206	0.126 (3.20)	0.062 (1.57)	0.025 (0.64)	0.035 (0.89)	0.175 (4.45)	0.029 (0.74)	0.071 (1.80)
1506	0.150 (3.81)	0.062 (1.57)	0.025 (0.64)	0.047 (1.20)	0.199 (5.05)	0.029 (0.74)	0.071 (1.80)
2010	0.198 (5.03)	0.097 (2.46)	0.025 (0.64)	0.071 (1.82)	0.247 (6.27)	0.029 (0.74)	0.103 (2.62)
2512	0.249 (6.32)	0.127 (3.23)	0.025 (0.64)	0.095 (2.43)	0.291 (7.39)	0.029 (0.74)	0.127 (3.23)

* For 0603 and 0805 land pattern dimensions are per IPC-782

TABLE 3 - COMPARATIVE PERFORMANCES⁽²⁾ - THIN FILM VS. BULK METAL® Z1-FOIL TECHNOLOGY

TEST OR CONDITIONS	ΔR LIMITS OF THIN FILM (TYPICAL)	ΔR LIMITS OF BULK METAL® Z1-FOIL TECHNOLOGY - FRSH SERIES ⁽¹⁾ (TYPICAL)
Thermal Shock, 5 x (- 65 °C to + 200 °C)	± 0.1 %	± 0.05% (500 ppm)
Low Temperature Operation, - 65 °C, 45 min at Rated Power	± 0.1 %	± 0.0025% (25 ppm)
Moisture Resistance	± 0.1 %	± 0.003% (30 ppm)
Load Life Stability, + 200 °C for 2000 h at Working Power (see table 4)	± 0.5 %	± 0.05% (500 ppm)
Long term stability, + 225 °C for 2000h, no power.	± 0.5 %	± 0.05 % (500 ppm)

Notes

(1) Performances obtained with ceramic PCB.

(2) As shown + 0.01 Ω to allow for measurement errors at low values.

FIGURE 3 - RECOMMENDED MOUNTING

Notes

- (1) IR and vapor phase reflow are recommended.
- (2) Avoid the use of cleaning agents which could attack epoxy resins, which form part of the resistor construction
- (3) Vacuum pick up is recommended for handling
- (4) In case of using soldering iron, measurement precautions should be taken to avoid damaging the resistor

PULSE TEST

TEST DESCRIPTION

All parts baked at +125°C for 1 hour and allowed to cool at room temperature for 1 hour, prior to testing. By using an electrolytic 0.01µF capacitor charged to 1200 VDC, a single pulse was performed on 30 units of 1206, 10KΩ of Surface Mount Vishay Foil resistor and Thin Film resistor. The unit was allowed time to cool down, after which the resistance measurement was taken and displayed in ppm deviation from the initial reading.

FIGURE 4 - PULSE TEST DESCRIPTION

TEST RESULTS

FIGURE 5 - PULSE TEST RESULTS AT 1200 VDC*

*Note: Average of 30 units yielded deviation of 30,723 ppm of the thin film vs. -14 ppm for the Bulk Metal® Foil

ELECTROSTATIC DISCHARGE (ESD)

ESD can be categorized into three types of damages

Parametric Failure - occurs when the ESD event alters one or more device parameters (resistance in the case of resistors), causing it to shift from its required tolerance. This failure does not directly pertain to functionality; thus a parametric failure may be present while the device is still functional.

Catastrophic Damage - occurs when the ESD event causes the device to immediately stop functioning. This may occur after one or a number of ESD events with diverse causes, such as human body discharge or the mere presence of an electrostatic field.

Latent Damage - occurs when the ESD event causes moderate damage to the device, which is not noticeable, as the device appears to be functioning correctly. However, the load life of the device has been dramatically reduced, and further degradation caused by operating stresses may cause the device to fail during service. Latent damage is the source for greatest concern, since it is very difficult to detect by re-measurement or by visual inspection, since damage may have occurred under the external coating.

TEST DESCRIPTION

By using an electrolytic 500 pF capacitor charged up to 4500 V, pulses were performed on groups of 10 units of 1206, 10 kΩ of three different Surface Mount Chip Resistors technologies, with an initial voltage spike of 2500 V (Figure 6). The unit was allowed time to cool down, after which the resistance measurement was taken and displayed in ppm deviation from the initial reading. Readings were then taken in 500 V increments up to 4500 V. Table 5 shows the maximum drift in each group.

New - For live demonstration of ESD pulses, please visit our new video landing page: <http://www.vishaypg.com/foil-resistors/videos/>
