

μP Supervisors with Separate VCC Reset and Manual Reset Outputs

General Description

The MAX6453–MAX6456 are low-power, dual-voltage μP supervisors featuring separate VCC reset and manual reset outputs. The dual outputs support both soft-system reset (interrupt) and hard-system reset (reboot) functions. The reset output asserts when any of the monitored voltages falls below its specified threshold and remains asserted for the reset timeout (140ms min) after all voltages exceed their respective reset thresholds. All devices are offered with nine factory-fixed reset thresholds for monitoring primary system voltages (VCC) from 1.8V to 5V and an adjustable reset input for monitoring a secondary system voltage down to 0.63V.

Each device has a manual reset input, a VCC reset output, and a manual reset output. The MAX6453/MAX6454 manual reset output asserts when the manual reset input is low. It remains asserted for the manual reset timeout period (140ms min) after the manual reset input transitions high. The MAX6453/MAX6354 manual reset input controls only the manual reset output and does not affect the VCC reset output.

The manual reset input of the MAX6455/MAX6456 controls both the manual reset and VCC reset outputs. When the manual reset input is low for less than the extended setup timeout period, only the manual reset output asserts and remains asserted for the manual reset timeout period (140ms min) after the manual reset input transitions high. If the manual reset input is low for at least the extended setup timeout period, the reset output also asserts and remains asserted for the reset timeout period (140ms min) after the manual reset input transitions high. This enhanced feature allows the implementation of a soft/hard-system reset combination.

The MAX6453/MAX6455 have active-low, push-pull reset and manual reset outputs, and the MAX6454/MAX6456 have active-low, open-drain reset and manual reset outputs. All devices are available in small SOT23-6 packages and are fully specified over the extended temperature range (-40°C to +85°C).

Applications

- Set-Top Boxes
- Consumer Electronics
- DVD Players
- Cable/DSL Modems
- MP3 Players
- Industrial Equipment
- Automotive
- Medical Devices

Features

- ◆ Precision Factory-Set Reset Thresholds From 1.6V to 4.6V
- ◆ Adjustable Threshold to Monitor Voltages Down to 0.63V
- ◆ Manual Reset Input with Extended Setup Period
- ◆ Immune to Short Voltage Transients
- ◆ Low 6μA Supply Current
- ◆ Guaranteed Valid Reset Down to VCC = 1.0V
- ◆ Active-Low RESET (Push-Pull or Open-Drain) Outputs
- ◆ 140ms (min) Reset Timeout Period
- ◆ Small SOT Package

Ordering Information

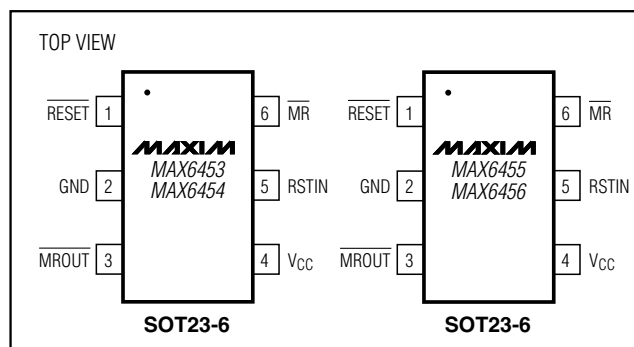

PART	TEMP RANGE	PIN-PACKAGE
MAX6453UT__-T	-40°C to +85°C	6 SOT23
MAX6454UT__-T	-40°C to +85°C	6 SOT23
MAX6455UT__-T	-40°C to +85°C	6 SOT23
MAX6456UT__-T	-40°C to +85°C	6 SOT23

Note: The first “_” is a placeholder for the threshold voltage level of the devices. A desired threshold level is set by the part number suffix found in Table 1. The third “_” is a placeholder for the manual reset setup period of the devices. A desired setup period is set by the letter suffix found in Table 2. All devices are available in tape-and-reel only. There is a 2500-piece minimum order increment for standard versions (Table 2). Sample stock is typically held on standard versions only. Nonstandard versions require a minimum order increment of 10,000 pieces. Contact factory for availability.

Devices are available in both leaded and lead(Pb)-free packaging. Specify lead-free by replacing “-T” with “+T” when ordering.

Selector Guide appears at end of data sheet.

Pin Configurations

μP Supervisors with Separate VCC Reset and Manual Reset Outputs

ABSOLUTE MAXIMUM RATINGS

(All voltages referenced to GND)

V _{CC}	-0.3V to +6V
Open-Drain $\overline{\text{RESET}}$, $\overline{\text{MROUT}}$	-0.3V to +6V
$\overline{\text{MR}}$, Push-Pull $\overline{\text{RESET}}$, $\overline{\text{MROUT}}$	-0.3V to (V _{CC} + 0.3V)
$\overline{\text{MR}}$, RSTIN	-0.3V to +6V
Input Current, All Pins	±20mA
Continuous Power Dissipation (T _A = +70°C) 6-Pin SOT23 (derate 8.7mW/°C above +70°C).....	696mW

Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow) Lead(Pb)-free	+260°C
Containing Lead.....	+240°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = 1.0V to 5.5V, T_A = -40°C to +85°C, unless otherwise specified. Typical values are at T_A = +25°C.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

µP Supervisors with Separate VCC Reset and Manual Reset Outputs

Pin Description

PIN		NAME	FUNCTION
MAX6453 MAX6454	MAX6455 MAX6456		
1	—	$\overline{\text{RESET}}$	Active-Low Push-Pull or Open-Drain Output. $\overline{\text{RESET}}$ changes from high to low when V_{CC} or RSTIN drops below its selected reset threshold. $\overline{\text{RESET}}$ remains low for the 140ms (min) reset timeout period after all monitored power-supply inputs exceed their selected reset thresholds. $\overline{\text{MR}}$ does not affect $\overline{\text{RESET}}$ output. For open-drain outputs, connect to an external pullup resistor.
—	1		Active-Low Push-Pull or Open-Drain Output. $\overline{\text{RESET}}$ changes from high to low when V_{CC} or RSTIN drops below its selected reset threshold. $\overline{\text{RESET}}$ remains low for the 140ms (min) reset timeout period after all monitored power-supply inputs exceed their selected reset thresholds. $\overline{\text{RESET}}$ changes from high to low after $\overline{\text{MR}}$ input is held low for the extended (typ) setup timeout period and deasserts 140ms (min) after $\overline{\text{MR}}$ deasserts. For open-drain outputs, connect to an external pullup resistor.
2	2	GND	Ground
3	3	$\overline{\text{MROUT}}$	Manual Reset Push-Pull or Open-Drain Output. $\overline{\text{MROUT}}$ asserts immediately after $\overline{\text{MR}}$ is pulled low. $\overline{\text{MROUT}}$ remains low for 140ms (min) after $\overline{\text{MR}}$ is deasserted. For open-drain outputs, connect to an external pullup resistor.
4	4	V_{CC}	V_{CC} Voltage Input. Power supply and input for the primary microprocessor voltage reset monitor.
5	5	RSTIN	Reset Input. High-impedance input to the adjustable reset comparator. Connect RSTIN to the center point of an external resistor divider to set the threshold of the externally monitored voltage.
6	—	$\overline{\text{MR}}$	Manual Reset Input. Internal 50k Ω pullup to V_{CC} . Pull $\overline{\text{MR}}$ low to immediately assert $\overline{\text{MROUT}}$. $\overline{\text{MR}}$ does not affect $\overline{\text{RESET}}$ output.
—	6		Manual Reset Input. Internal 50k Ω pullup to V_{CC} . Pull $\overline{\text{MR}}$ low to immediately assert $\overline{\text{MROUT}}$. $\overline{\text{RESET}}$ changes from high to low after $\overline{\text{MR}}$ input is held low for the extended (typ) setup timeout period.

MAX6453-MAX6456

μP Supervisors with Separate VCC Reset and Manual Reset Outputs

Figure 1. MAX6453/MAX6454 Timing Diagram

Detailed Description

Reset Output

The reset output is typically connected to the reset input of a microprocessor (μP). A μP's reset input starts or restarts the μP in a known state. The MAX6453–MAX6456 μP supervisory circuits provide the reset logic to prevent code-execution errors during power-up, power-down and brownout conditions (see the *Typical Operating Circuit*).

$\overline{\text{RESET}}$ changes from high to low whenever the monitored voltage (RSTIN or VCC) drops below the reset threshold voltages. When V_{RSTIN} and VCC exceed their respective reset threshold voltages, $\overline{\text{RESET}}$ remains low for the reset timeout period, and then goes high. $\overline{\text{RESET}}$ changes from high to low after $\overline{\text{MR}}$ input is held low for the extended (typ) setup timeout period and deasserts 140ms (min) after $\overline{\text{MR}}$ deasserts.

$\overline{\text{RESET}}$ is guaranteed to be in the proper output logic state for VCC inputs $\geq 1\text{V}$. For applications requiring valid reset logic when VCC is less than 1V, see the *Ensuring a Valid $\overline{\text{RESET}}$ Output Down to VCC = 0V* section.

Manual Reset

The MAX6453/MAX6454 contain a manual reset output (MROUT) that asserts low immediately after driving $\overline{\text{MR}}$ low and remains low for the reset timeout period after $\overline{\text{MR}}$ goes high (Figure 1). The pushbutton manual reset has no effect on the $\overline{\text{RESET}}$ output. MROUT output can be used to drive an NMI (nonmaskable interrupt) on the processor to save valuable data.

The MAX6455/MAX6456's MROUT is asserted immediately upon driving $\overline{\text{MR}}$ low. Driving $\overline{\text{MR}}$ low for longer than the extended (typ) setup timeout period asserts $\overline{\text{RESET}}$. When $\overline{\text{MR}}$ is deasserted, MROUT and $\overline{\text{RESET}}$ remain asserted low for the reset timeout period after $\overline{\text{MR}}$ goes high (Figure 2).

Adjustable Input Voltage (RSTIN)

The MAX6453–MAX6456 monitor the voltage on RSTIN using an adjustable reset threshold set with an external resistor voltage divider (Figure 3). Use the following formula to calculate the externally monitored voltage ($V_{\text{MON-TH}}$):

$$V_{\text{MON-TH}} = V_{\text{TH-RSTIN}} \times (R1 + R2)/R2$$

where $V_{\text{MON-TH}}$ is the desired reset threshold voltage and $V_{\text{TH-RSTIN}}$ is the reset input threshold (0.63V). Resistors R1 and R2 can have very high values to minimize current consumption due to low leakage currents. Set R2 to some conveniently high value (250kΩ, for example) and calculate R1 based on the desired reset threshold voltage, using the following formula:

$$R1 = R2 \times (V_{\text{MON-TH}}/V_{\text{TH}} - 1)\Omega$$

Applications Information

Interrupt Before Reset

To minimize data loss and speed system recovery/test, many applications interrupt the processor or reset only portions of the system before a processor hard reset is asserted. The extended setup time of the MAX6455/MAX6456 MR input allows the same pushbutton (Figure 4) to control both the interrupt and hard reset functions. If the pushbutton is closed for less than the extended setup timeout period, the processor is only interrupted (MROUT). If the system still does not respond properly, the pushbutton can be closed for the full extended setup timeout period to hard reset the processor (RESET). If desired, connect a LED to the RESET output to turn off (or on) to signify when the pushbutton is closed long enough for a hard reset (the same LED can be used as the front panel power-on display).

Interfacing to Other Voltages for Logic Compatibility

The open-drain RESET output can be used to interface to a μP with other logic levels. As shown in Figure 5, the open-drain output can be connected to voltages from 0 to 6V.

Generally, the pullup resistor connected to the RESET connects to the supply voltage being monitored at the IC's VCC pin. However, some systems might use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply (Figure 5). Keep in mind that as the supervisor's VCC decreases toward 1V, so does the IC's ability to sink current at RESET (RESET is pulled high as VCC decays toward 0). The voltage where this occurs depends on the pullup resistor value and the voltage to which it is connected.

Ensuring a Valid RESET Down to VCC = 0V (Push-Pull RESET)

When VCC falls below 1V, RESET current-sinking capabilities decline drastically. The high-impedance CMOS-logic inputs connected to RESET can drift to undetermined voltages. This presents no problem in most applications, because most μPs and other circuitry do not operate with VCC below 1V.

In applications where RESET must be valid down to 0V, add a pulldown resistor between RESET and GND for the push/pull outputs. The resistor sinks any stray leakage currents, holding RESET low (Figure 6). The value of the pulldown resistor is not critical; 100kΩ is large enough not to load RESET and small enough to pull RESET to ground. The external pulldown cannot be used with the open-drain reset outputs.

Transient Immunity

In addition to issuing a reset to the μP during power-up, power-down and brownout conditions, these supervisors are relatively immune to short duration falling transients (glitches). The graph Maximum Transient Duration vs. Reset Threshold Overdrive in the Typical Operating Characteristics section shows this relationship.

The area below the curves of the graph is the region in which these devices typically do not generate a reset pulse. This graph was generated using a negative going pulse applied to VCC, starting above the actual reset threshold (VTH) and ending below it by the magnitude indicated (reset-threshold overdrive). As the magnitude of the transient increases (VCC goes further below the reset threshold), the maximum allowable pulse width decreases. Typically, a VCC transient that goes 100mV below the reset threshold and lasts 20μs or less does not cause a reset pulse to be issued.
