POWER SOLUTIONS

Energy-efficient power analog, power discrete, and optoelectronic solutions that maximize energy savings in power sensitive applications

Saving our world, 1mW at a time™

FAIRCHILD'S POWER SOLUTIONS

As a global leader in power, Fairchild Semiconductor enables energy-efficient designs with a combination of advanced power technologies, brand reliability and unequaled customer support. We combine three core technologies—power analog, power discrete and optoelectronic—into unique solutions. Our functional, process and packaging innovations along with the industry's best power systems expertise ensure that system-level efficiencies are realized, allowing maximum energy savings in power-sensitive designs. With one of the broadest and deepest power portfolios, you can find just the component performance you need for virtually every application including: power supplies, lighting applications, computing, industrial controls, telecommunications and home appliances. In addition, Fairchild stands for quality and reliability as both a technology and business partner—an advantage made possible with our own design, fabrication, assembly and testing facilities worldwide. Overall, Fairchild makes the design challenge easier with our products that require less tweaking, adjusting or calibrating; the elimination of external components; and the best customer support in the industry comprised of online tools, design labs, FAEs and regional centers staffed with experienced power engineers.

POWER FACTOR CORRECTION

PFC CONTROLLERS

Power Factor Correction (PFC) Stand-Alone and PFC/PWM Combo Controllers

Fairchild's full line of both stand-alone PFC controllers and PFC/PWM combo controllers offer crucial cost and energy saving solutions that address the demanding requirements of a diverse range of medium and high power Switch Mode Power Supply (SMPS) designs.

- Offerings include both Boundary Conduction Mode (BCM) and Continuous Conduction Mode (CCM)
- Synchronized clock output to reduce system noise and to synchronize to downstream converter
- Patented one-pin voltage error amplifier with advanced input

Fairchild has a complete PFC technology portfolio from low to high power levels to make energy delivery more efficient

PWM CONTROLLERS

Pulse Width Modulator (PWM) Controllers

Fairchild's green-mode PWM controllers have a function to minimize the standby power consumption enabling power supplies to meet international energy regulation requirements. The green-mode function provides off-time modulation, which gradually decreases the switching frequency as the load drops under light load conditions. Under zero-load conditions, the power supply enters burst mode.

Fairchild's FPS products cover a wide range of power supply applications—from small battery chargers to large televisions, up to 250W. These highly integrated FPS devices combine the functionality of a fully avalanche-rugged SenseFET, a current mode pulse width modulation (PWM) IC and various protection functions, to simplify design and improve system reliability. Fairchild's FPS products provide the highest levels of efficiency to meet the standards as specified by international regulatory agencies.

Green FPS™

Fairchild's Green FPS™ provides high energy efficiency and system reliability in DVD players, set-top boxes, LCD monitors and other power supply designs below 25W. Based on Fairchild's proprietary valley switching technique, these Green FPS products increase power conversion efficiency by 1% and reduce EMI up to 5dB, when compared to conventional hard-switching topologies. Utilizing an advanced burst mode operation, the Green FPS e-Series devices meet standby power regulations by reducing standby power consumption to below 0.2W at no load conditions (below 1W at 0.5W load).

Features & Benefits

- Optimized for valley switching operation
 - Frequency clamp in the valley switching mode allows the efficiency levels to remain high at lighter load levels
- High efficiency through minimum voltage switching
- 1% improvement over hard-switching topologies
- Low EMI through valley switching and inherent frequency modulation
- Up to 5dB over hard-switching topologies
- Advanced burst-mode operation for low standby power consumption and minimized audible noise
- Narrow frequency variation range over wide load and input voltage variation
- Pulse-by-pulse current limit
- Various protection functions: over load protection (OLP), over voltage protection (OVP), abnormal over current protection (AOCP), internal thermal shutdown (TSD), output short protection (OSP)
- Under voltage lock out (UVLO) with hysteresis
- Internal startup circuit
- Built-in soft-start (1.5ms)
- Minimum component counts on primary side

FPS-HALF-BRIDGE RESONANT CONVERTERS

The FSFRxxxx family of highly integrated Green FPST™ products increases power efficiency and system reliability while reducing valuable design time in resonant converter designs. Offering a "system-in-a-package" approach that integrates everything necessary to build reliable and efficient resonant converters, this power switch family includes a pulse-frequency-modulation (PFM) controller with a high voltage gate driver circuit and two fast recovery MOSFETs (FRFET®) along with soft-start, burst-mode operation and important protection features into a thermally-efficient SIP-9 package.

Features & Benefits

Ease of Design

- Highly integrated up to 450W half-bridge resonant power switch
 - Integrates PFM controller, high voltage gate driver circuit, two fast recovery MOSFETs (FRFET)
 - No heatsink needed for normal power supplies up to 180W
 - Minimum component count on primary-side

System Efficiency

- ZVS technique improves power efficiency and decreases EMI
 - Advanced burst mode operation reduces power consumption to below 1W

System Reliability

- Excellent noise immunity due to built-in high-side drive circuit with common mode noise canceling technique
 - Minimizes the effect of reverse recovery against abnormal operation conditions due to the MOSFET's fast recovery body diodes
 - Built-in protection features: OVP, OLP, OCP, AOCP, TSD

FPS-HALF-BRIDGE RESONANT CONVERTERS

FSFA2100 FPS™ for Asymmetric Half-Bridge & Active-Clamp Topologies

An integrated PWM controller and SuperFET™ MOSFET, the FSFA2100 is specifically designed for Zero-Voltage-Switching (ZVS) half-bridge converters requiring minimal external components. The internal controller includes an oscillator, under-voltage lock out, leading-edge blanking (LEB), optimized high-side and low-side gate driver, internal soft-start, temperature-compensated precise current sources for loop compensation and self-protection circuitry.

Features & Benefits

- Better than LLC for low output voltages($< 12V$) due to lower output-current ripple
- Duty cycle control for complementary (D/1-D) power switches (50% D limit)
- Internal MOSFET with Fast-Recovery body diode ($t_{rr} < 160\text{ns}$)
- High efficiency through zero voltage switching (ZVS): typ. Eff=93~94% for $V_O=24V$
- Internal soft-start (15ms) & optimized dead time (200ns)
- Pulse-by-Pulse current limit
- Burst mode operation for low standby power consumption
- Various protection functions: Over Load Protection (OLP), Over Voltage Protection (OVP), Abnormal Over Current Protection (AOCP), Internal Thermal Shutdown (TSD)
- -40 to 130°C ambient operation

NON-ISOLATED DC-DC

CONTROLLERS AND REGULATORS

Fairchild's highly integrated non-isolated DC-DC controllers and regulators provide solutions for today's market demands that require lower power consumption, highly efficient integrated functions and smaller packages.

Features & Benefits (FAN21SV06 TinyBuck™ Controller)

All-in-one TinyBuck regulator containing a controller, driver and fully optimized MOSFETs

- Up to 94% efficiency
- Wide input range: 6.5V to 24V
- Up to 6A continuous current at 85°C
- Output voltage from 0.8V to 90% V_{IN}
- External synchronization
- Internal 5V regulator with single supply operation
- Ultra-compact MLP 5mm x 6mm package

Fully Integrated Synchronous Buck Regulator Featuring External Synchronization and Internal 5V Regulator

Features & Benefits (FAN4603)

- Solder and play converter - no passive components required
- 2.3V to 5.5V input voltage range
- 600mA output current
- $V_{OUT} = 1.0V, 1.2V, 1.3V, 1.5V, 1.8V$
- Up to 91% efficiency
- UVLO, TSD, and SCP protection
- 3.0 x 4.5, 10-lead 0.5mm pitch LGA package

HIGH VOLTAGE GATE DRIVERS (HVICs)

Fairchild's high voltage gate drivers (HVICs) improve system reliability by utilizing an innovative common-mode dv/dt noise cancelling circuit that provides excellent noise immunity. With a voltage capability up to 600V and a very fast switching speed these drivers are optimal for driving MOSFETs and IGBTs in a wide array of applications.

Features & Benefits

- Better noise immunity (due to noise cancelling circuit over high dv/dt common-mode noise)
- I_{QBS} and I_{QCC} are lower than in competitive devices
- Extended allowable negative V_s swing to -9.8V for signal propagation at $V_{CC} = V_{BS} = 15V$
- Matched propagation delay below 50ns
- UVLO functions for both channels
- TTL-compatible input logic threshold levels

Fairchild's low-side gate drivers (FAN31xx and FAN32xx) offer an unequaled combination of higher performance, smaller size and more input options for driving N-Channel power MOSFETs and IGBTs. Forty different devices provide choices of 1A, 2A, 4A and 9A current ratings in single- or dual-channel versions. These drivers deliver fast switching and accurate timing to maximize efficiency in high frequency power converter designs.

Features & Benefits

- Package options: industry's smallest packages (2mm x 2mm and 3mm x 3mm MLP) in addition to standard packages (SOIC, SOT)
- Ease of design: CMOS or TTL input thresholds for all products
- Design flexibility: 2 inputs for each channel (dual-input or input + enable)
- Maximize efficiency: short and well-controlled time delays for 1MHz switching, paralleling drivers and optimizing drive timing
- Rugged: 20V (V_{DD} to GND) abs max; >4kV ESD; >500mA reverse current; -40°C to 125°C ambient temperature range

SYNCHRONOUS RECTIFIER CONTROLLERS

Fairchild offers a complete power efficiency improvement solution with the primary-side synchronous rectifier (SR) trigger controller, FAN6210, and the dual-channel SR controller on the secondary side to save power loss respectively. The FAN6210 can be used with any PWM controller that can drive a dual-forward converter. It provides drive signals for the primary-side power switch and also the SR drive signal for the secondary side FAN6206 through a pulse transformer. This solution provides a simple control method and improved power system reliability.

Features & Benefits

- Improves efficiency 1.5%~3% vs Schottky diode solution with SRs FDP5800 (60V, 4.7mΩ) or FDP8896 (30V, 6mΩ)
- Power system reliability improvement
- Simple control method
- Reduces component count

Fairchild's family of supervisors is designed to provide voltage and current supervisor function, remote on/off function (PSON), power good (PGO) indicator function, and fault protection (FPO) function for switching power systems. These products also provide the over-voltage protection (OVP), over-current protection (OCP) and under voltage protection (UVP) for 3.3V, 5V and two 12V.

Features & Benefits (SG6520)

- Two 12V sense input pins: VS12 and VS12B
- Over-voltage protection (OVP) for 3.3V, 5V and two 12V
- Over-current protection (OCP) for 3.3V, 5V and two 12V
- Under-voltage protection (UVP) for 3.3V, 5V and two 12V
- Open drain output for PGO and FPO pins
- 300ms power good delay
- 300ms turn on delay for 3.3V, 5V and two 12V
- 2.8ms PSON control to FPO turn-off delay
- 48ms PSON control delay
- No lockup during the fast AC power on/off
- Wide supply voltage range from 4.2V to 15V
- Programmable over temperature protection (OTP)

Deuxspeed®

The Deuxspeed® is a high performance diode composed of two 300V dice in series and silicon nitride passivated ion-implanted epitaxial planar construction. This device is intended for use as boost diode in continuous mode power factor correctors and hard switching conditions and internal ceramic insulated package allow flexible heatsinking on common or separate heatsink power factor correction and hard switching conditions. The internal ceramic insulated package allows flexible heatsinking on common or separate heatsink.

Features & Benefits

- High speed switching, $t_{rr} < 25\text{ns}$ at rating current
- High reverse voltage and high reliability
- Max forward voltage, $V_F < 3.6\text{V}$ @ 25°C
- Insulated voltage, 2500V DC

DIODES AND RECTIFIERS

RECTIFIERS

Fairchild's latest family of rectifiers (Stealth™ II and Hyperfast II) features fast reverse recovery and soft recovery characteristics that enable reduced MOSFET switching losses and EMI in continuous-conduction mode (CCM) power factor correction (PFC) designs.

Features and Benefits

- Energy efficiency through high speed switching and low forward voltage drop
- System reliability attained by softer recovery characteristics
- Space savings resulting from elimination of the snubber circuit and reduced EMI filter size
- Applications include PFC in server/telecom, PDP TV, computing and adapters

INTEGRATED POWER SOLUTIONS

FET PLUS DRIVER MULT-CHIP MODULE, DrMOS

DrMOS Products FDMFxxxx Series

The FDMFxxxx series is Fairchild's family of fully-optimized integrated driver plus MOSFET power stage solutions for applications requiring a high current synchronous Buck converter.

Features & Benefits

Higher System Efficiency

- Higher efficiency than conventional discrete solutions under high, medium and light load conditions
- Average power losses across the full operating range are reduced by 14% when compared to discrete solutions

Critical Space Savings

- Replaces two MOSFETs, one diode (Schottky or bootstrap) and one driver IC
- Reduces 33% of component count compared to conventional discrete solutions
- Saves 73% of valuable board space

Easier and Faster Design

- Designers no longer need to spend valuable time and resources in optimizing and matching FETs with respective drivers. Fairchild has already achieved this optimization within DrMOS.

Typical Buck Converter Application Circuit

Test conditions:

- Input voltage = 12V
- Output voltage = 1.3V
- Frequency = 300kHz
- Soak time = 10 sec
- Inductor = 0.47μH
- No heatsink
- Airflow provided by VTT tool
- 4 phase VR11-compliant demo boards
- Efficiency measured at the output of the Buck converter

FULL FUNCTION LOAD SWITCHES, IntelliMAX™

Fairchild's IntelliMAX™ family of advanced full function load switches reduces board space, component count and complexity in power management designs for the latest generation of battery powered devices. This unique combination of protection, control and fault monitoring features allows for a simple, space-saving solution in critical time-to-market product applications without sacrificing design performance.

Features & Benefits

- Product families address a wide operating voltage range (0.8V to 16V)
- Soft-start control reduces in-rush current
- Integrated fixed and adjustable current-limit value
- Under-voltage lockout for system protection
- Thermal shutdown to reduce excessive heating or system damage
- Fast current limit response time
- Optional flag for fault conditions, fault blanking and auto re-start to optimize fault condition management
- Low shutdown and leakage currents to conserve critical battery life
- Options for reverse current blocking capability and power good function

INTEGRATED POWER SOLUTIONS

INTEGRATED MOSFET MODULES

Fairchild's integrated MOSFET module family enables higher conversion efficiency while significantly reducing board space in synchronous Buck designs. Each module in the FDMS96xx series combines a carefully selected high side and low side N-Channel MOSFET and one monolithically integrated Schottky diode into a single, space-efficient, 5mm x 6mm MLP package. The pin-out design of the FDMS96xx series is optimized for direct and easy connection in PCB layouts to standard driver ICs. This innovative package concept shortens design time and reduces parasitic inductances in board layout traces, improving overall system efficiency.

Features & Benefits

Higher efficiency compared to conventional discrete solutions

- Optimized matching and sizing of high and low side MOSFETs for better efficiency in Buck converters
- Integrated Schottky diode for improved low side MOSFET performance

Ultra-compact size

- Space savings up to 50% vs. discrete options

Faster and easier design. Faster time-to-market

- High side and low side MOSFETs internally connected
- Optimized pin-out for easier layout with standard driver ICs

IGBTs

IGBTs

Fairchild's IGBTs are optimized for Switch Mode Power Supply designs offering better V_{SAT} and E_{OFF} . Additionally, this control smoothes the switching waveforms for less EMI. IGBTs are manufactured using an optimized design process which offers better control and repeatability of the top side structure, thereby providing tighter specifications.

IGBTs vs. MOSFETs

- Reduce conduction losses due to low saturation voltage
- Reduce current tail, reduce switching losses
- Improve transistor and system reliability
- IGBTs superior in current density facilitate higher output power

Reduce System Cost

- Smaller die size for higher voltages reduces overall costs
- May eliminate components
- Increase operating frequency and reduce transformer/filter costs
- Fastest switching IGBTs in the market today

SupreMOS®

The SupreMOS MOSFET, Fairchild's latest generation of high voltage super-junction MOSFETs, employs a deep trench filling process that differentiates it from preceding multi-epi based technologies. By utilizing this advanced technology and precise process control, SupreMOS provides world class $R_{\text{specific on resistance}}$, superior switching performance and ruggedness.

**High Voltage MOSFETs**

Fairchild's MOSFET portfolio is one of the industry's broadest with outstanding low on-resistance and low gate charge performance. This is the result of proprietary technologies such as the SupreMOS, SuperFET, UniFET™ and FRFET® MOSFETs. Fairchild's extensive packaging solutions offer advantages such as superior size, low package height and excellent thermal and electrical performance.

Features & Benefits

- Ultra-low $R_{D(on)}$ resulting in low conduction losses and improved efficiency
- Best-in-class di/dt rating that allows the devices to operate at higher frequencies to ensure ruggedness and reliability
- Lower switching losses due to lower effective output capacitance ($C_{OSS,\text{eff}}$) that allow high frequency switching

POWER MOSFETs <250V

Fairchild's <250V power MOSFETs have been specifically designed to improve the efficiency of DC-DC converters. Leveraging new techniques in MOSFET construction, the various components of gate charge and capacitance have been optimized to reduce switching losses. Low gate resistance and very low Miller charge enable excellent performance with both adaptive and fixed dead time gate drive circuits. Very low $R_{DS(ON)}$ has been maintained to provide an extremely versatile device.

Features & Benefits

- High performance trench technology for extremely low $R_{DS(ON)}$ and gate charge
- RoHS compliant
- State-of-the-art packaging provides low thermal resistance

High Speed Optocoupler

3.3V/5V high-speed logic gate optocouplers work with high-side or low-side gate drivers to provide isolation within the power solutions. These products utilize Fairchild's patented coplanar packaging technology, Optoplanar®, and are optimized to achieve excellent noise immunity, characterized by high common mode transient immunity and power supply rejection specifications, allowing these devices to operate in noisy industrial environments.

Features & Benefits

- High bandwidth up to 25Mbps and 6ns pulse width distortion
- Dual supply voltages, 3.3V and 5V, enabling CMOS compatibility and level translation capability
- Electrical characteristics guaranteed beyond the full industrial temperature range (-40°C to +110°C)
- UL1577 (3,750 VACRMS for 1 min) and IEC60747-5-2 certification for increased reliability

Optically Isolating Digital Control

High-Speed Optocoupler drives Intelligent Power Module to prevent catastrophic failure of the motor drive, and meet safety regulatory standards

Gate Drive Optocoupler

These IGBT/MOSFET gate drive optocouplers complement Fairchild's strong, well-established offering in the discrete power IGBT/MOSFET line of products. Fairchild now offers customers one-stop shopping from the logic control portion of the circuit to the isolated gate driver to the power IGBT/MOSFET. This combined solution converts the mW to kW providing electrical isolation between the primary and secondary circuits.

Features & Benefits

- Wide operating voltage range of 15V to 30V
- High output current capability up to 2.5A
- 5kV isolation voltage rating with >8mm creepage and clearance distance
-1414V (peak) working voltage (UIORM)
- High common mode transient immunity up to 35kV/us min.

Snubberless TRIAC Drive Optocouplers

The optocouplers feature a built-in active dv/dt clamp providing best-in-class noise immunity (dv/dt) of 10,000V/μs, which is superior to the average dv/dt rating (1,500V/μs) of monolithic TRIAC drivers. This superior performance eliminates the RC snubber network required for lower dv/dt-rated monolithic opto TRIAC drivers.

Features

- Integrated zero-cross inhibit circuit prevents switching near the peak of the AC mains
- Random phase drivers switch at any AC mains voltage level
- Reduce bill of materials (BOM)
- Ideal for noisy industrial environments

Applications

- Solid state relays
- AC motor controls
- Lighting ballasts

GLOBAL POWER RESOURCESM

Engineers need a comprehensive portfolio of components and design support services to solve today's power and energy problems. It is this foundation of practical solutions that has allowed us to deploy the industry standard for customer support. We call it our Global Power Resource (GPR)—and here are some of the ways you can leverage it for your designs:

Engineering Connections—Here you will find our latest videos, online seminars and podcasts to help you with your designs. We also invite you to join a conversation on any of our popular blogs.

Online Support—Our power and application engineers in the labs, and in the field, have combined their skills to offer a comprehensive suite of design and knowledge tools. These resources are available 24/7 in the Design Center found on our website. The Design Center includes application notes, evaluation boards, online design tools and other resources.

GPR Centers—Each is a fully-equipped applications laboratory, staffed by an experienced team of power engineers. These regional centers can take a design from concept, to full schematics, to a completed board with fully characterized engineering and manufacturing files, or to any stage in between.

Field Application Engineers—Our FAEs are power engineers, with years of design experience. They bring the full range of Fairchild's power expertise to your facility, to be an extension of your design team.

The FEB167 Evaluation Board (FAN2106)

FETBench provides a live data sheet environment for over 300 of the most popular Fairchild MOSFET devices. FETBench uses electrical and thermal simulation to give fast accurate analysis not readily available from a normal data sheet.

Device Analysis
Quickly select a MOSFET based on your device requirements. Then analyze device on a customizable Curve Tracer and Dynamic Characteristics test circuits.

Application Analysis
Optimize MOSFET selection based on your application requirements. Then evaluate device performance under conditions relevant to your specific application.

Thermal Analysis
Define your printed circuit board geometry, ambient airflow conditions, component numbers and board location, then use our new WebSiM™ thermal simulation to evaluate the thermal performance of your design.

1.5W SINGLE OUTPUT BUCK

1.5W Single Output Buck using FSQ510 Fairchild Power Switch

Typical Applications: Small home or factory automation systems, auxiliary power supplies in large automation systems

This compact non-isolated Buck solution draws less than 170mW standby power and uses a minimal number of components. D103 is used to set the output voltage to 15V. The voltage can be increased by adding an additional Zener diode in series with D105, facing the other direction. Here the valley switching is disabled with R102 to minimize component count.

- Less than 170mW standby power
 - Ideal for applications permanently connected to the AC supply
 - Full load efficiency better than 75%
 - Excellent efficiency for such a low wattage power supply
 - Line and load regulation within 2% for test board
 - FSQ510 is a current mode device

Product Number	Description
FSQ510	Green-mode Fairchild Power Switch (FPS™) (320mA/700V)
BZX84C15	Zener diode (15V/0.35W)
1N4937	Fast recovery diode (1A/600V)
BC847B	General purpose transistor (50V/100mA)

DESIGN EXAMPLES

3.5W CHARGER

3.5W Charger Using FSEZ1317 Primary Side Control PWM Controller (5V Out)

Typical Applications: Cell Phone Charger

This condensed 50kHz flyback converter uses a primary side regulation controller that controls the output voltage and current precisely with the information in the primary side of the power supply only, removing the output current sensing loss and also eliminating all secondary-feedback circuitry.

- 82% average efficiency at 115 V_{AC}, 78% at 230V_{AC}
- <30mW standby power consumption at all line voltages
- Lowest part count & BOM cost

Product Number	Description
FSEZ1307	Integrated primary-side regulation PWM controller with MOSFET
1N4007	Diode (1A/200V)

7W DUAL OUTPUT SEPIC

7W Dual Output SEPIC using FSQ0265 Fairchild Power Switch

Typical Applications: Power supply for motor drive bootstrap and microcontroller circuits

This compact non-isolated SEPIC solution provides the two voltage outputs needed for a motor drive circuit: a 15V output to power the bootstrap circuit for a high voltage driver, and the power for microcontroller/DSP and the auxiliary components.

- Ideal solution for motor drive power
 - Dual output possible without the need for large inductors
- Low EMI generation from the switching power supply
 - SEPIC EMI is lower than Buck EMI due to continuous input current
 - Simplifies EMI design

Product Number	Description
FSQ0265RN	Green-mode Fairchild Power Switch (FPS™) (1.2A/600V)
KA78L05	Voltage regulator (5V/100mA)
FDLL4148	General purpose diode (200mA/100V)
BZX84C15	Zener diode (15V/0.35W)
BC847B	General purpose transistor (50V/100mA)

20W Consumer Adapter (5V, 1.5A/11V, 1.1A)

Typical Applications: Set-top box, DVD players and home appliances

67 kHz flyback solution uses the highly integrated FSL136 green-mode FPSTTM. This controller reduces total component count, design size, and weight by integrating high-voltage power switching regulators that combine an avalanche-rugged SenseFET with a current-mode PVM control block.

- >83% average efficiency at 115 V_{AC}, 84.5% at 230 V_{AC}
- <50mW standby power consumption at any input voltage

Product Number	Description
FSL136MR	Green-mode Fairchild Power Switch (FPS TM)
FOD817B	DIP-4 phototransistor output optocoupler
KA431LZ	Adjustable/ 2.5V, 0.5% tolerance shunt regulator
1N4007	Diode (1A/1000V)

70W OUTPUT LLC RESONANT CONVERTER

70W Output LLC Resonant Converter Power Supply using FSFR2100

Typical Applications: Power supply for industrial applications (70W - 450W), consumer set-top boxes

The FSFR2100 LLC resonant regulator can be used as the building block for resonant power supplies ranging from 70W to 450W. Resonant converters are extremely efficient. The co-packaged MOSFETs and controller make the design easier, simpler, and more cost effective. The example below shows an industrial application requiring 70W output. No heatsink is needed.

- High efficiency (90-94%) through a zero voltage switching (ZVS technique)
- Low EMI due to ZVS
- Minimal component count on the primary side
- Eliminates need for a heat sink on the FSFR2100 up to 200W
- Built-in protection features (overvoltage, overcurrent, overload, thermal shutdown)
- Less than 1.8W input standby power

Product Number	Description
FSFR2100	LLC resonant regulator
FOD2741BTV	Optically isolated amplifier (1%)
FYP2010DN	Dual power Schottky diode (20A/100V)
RS1J	Fast recovery rectifier (1A/600V)
1N4007	General purpose rectifier (1A/1000V)
BAT54S	Dual Schottky diode (300mA/30V)
BAT54	Single Schottky diode (300mA/30V)
FDLL4148	General purpose diode (200mA/100V)
BZX79C22	Zener diode (22V/0.5W)

DESIGN EXAMPLES

200W LLC RESONANT HALF-BRIDGE CONVERTER

200W LLC Resonant Half-Bridge Converter Using the FAN7621 (340-400V_{DC} to 24V_{DC})

Typical Applications: Telecom power supplies, LCD TVs, servers

67kHz flyback solution uses the highly integrated FSL136 green-mode FPS™. This controller reduces total component count, design size, and weight by integrating high-voltage power switching regulators that combine an avalanche-rugged SenseFET with a current-mode PWM control block.

- 95% efficiency at 390 V_{DC} in full load
- <350mV PP ripple
- 30ms holdup (390V_{DC} in full load)
- All components <70°C at full load with natural convection

Product Number	Description
FAN7621	PFM controller for half-bridge resonant converters
FOD817B	DIP-4 phototransistor output optocoupler
KA431	Adjustable/2.5V, 2% tolerance shunt regulator
2N2222	NPN transistor
2N3906	PNP transistor
FQPF8N60C	600V/ 11A QFET® MOSFET
1N4937	600V/1.0A fast recovery rectifier
1N4148	100V/0.2A high conductance fast diode
FYPF2010DN	100V/20A Schottky barrier rectifier
1N4736	6.8V 1W Zener diode

High Efficiency PFC Pre-Regulator

Typical Applications: Power supplies such as servers, networking, telecom, and solar micro inverters

The front-end of this high efficiency AC-DC power supply uses an interleaved two-channel boundary conduction mode (BCM) approach to do power factor correction. ZCS, ZVS (at low-line), valley switching (at high-line) and phase dropping at light load provide a high and flat efficiency performance from 15% through 50% to 100% load. In addition, the two power stages allow spreading of the smaller components for a very low profile design of <19mm total height.

- Interleaved BCM PFC Stage using FAN9612
 - Zero-Current Switching (no diode reverse recovery losses)
 - Zero-Voltage Switching (ZVS) when $V_{IN} < \frac{1}{2} V_{OUT}$
 - Drops one phase at light load to reduce switching losses
 - Accurate valley detection to minimize C_{OSS} switching losses
 - Low-Cost Boost Stage Diodes without need for SiC Diodes
 - Programmable PFC closed-loop soft-start
 - PFC Power-limit and Current-limit protection per channel
 - PFC Input voltage feed-forward function that
 - (a) improves voltage regulation,
 - (b) provides constant power limit.

Product Number	Description
ES3J	Diode, 600V, 3A, Ultra-fast recovery
S1J	Diode general purpose 1A, 600V
GBU6J	Diode Bridge, 6A, 1000V
MBR0540	Diode, Schottky, 40V, 500mA
MBR0530	Diode Schottky 30V 500mA
DNP	Diode, 600V, 3A, Ultra-fast recovery

DESIGN EXAMPLES

300W INTERLEAVED BCM PFC + ASYMMETRICAL HALF-BRIDGE CONVERTER

High Efficiency Isolated DC-DC Converter

Typical Applications: Power supplies such as servers, networking, telecom, and solar micro inverters

The back-end of the high efficiency AC-DC power supply uses an asymmetrical half-bridge isolated DC-DC design that provides a fixed frequency zero voltage switching (ZVS). The efficiency is further improved by employing burst-mode operation at light load and use of the current doubler and self-driven synchronous rectification.

- Asymmetrical Half-Bridge PWM Stage using FSFA2100
 - Fixed frequency Zero-Voltage Switching (ZVS)
 - Integrated 600-V SuperFET™ with Fast-Recovery Body Diode
 - Burst-Mode Operation for Low Standby Power Consumption
- Synchronous Rectification with Low-Side Driver FAN3224T
 - Dual Non-Inverting Low-Side Gate Driver
 - 4.5 to 18V Operating Range
 - 5A peak Sink and Source at $V_{DD} = 18V$

Product Number	Description
ES3J	Diode, 600V, 3A, Ultra-fast recovery
MMSZ5235B	Diode, Zener, 6.8V, 200mA
MBR0530	Diode Schottky 30V 500mA
FDP047N08	MOSFET, NCH,100V, PowerTrench®, 164A, 4.7mOhm
FDP025N06	MOSFET, NCH,100V, PowerTrench®, 164A, 4.7mOhm

DESIGN EXAMPLES

350W SINGLE STAGE CONTINUOUS CONDUCTION MODE (CCM)

350W Single Stage Continuous Conduction Mode (CCM) PFC with 5V_{sb} Modules: Universal AC to 387V_{dc}

Typical Applications: Power supply for industrial applications (70W - 450W), consumer set-top boxes

This universal input range continuous conduction mode (CCM) power-factor corrected pre-regulator (FAN6982) provides a fixed frequency solution to AC-DC front-ends requiring light load efficiency improvement by adjusting the output voltage at light load and low AC line input voltage.

- 94% full-load efficiency at $115V_{AC}$, 95% at $230V_{AC}$
 - < 7% THD at full load, $100V_{AC}$ or $230V_{AC}$

Product Number	Description
FAN6982	CCM PFC controller
FSBH0F70	Green-mode FPs™
FOD817A	DIP-4 phototransistor output optocoupler
FCA16N60N	600V SupreMOS™ MOSFET

SB540	5.0A Schottky barrier rectifier
1N4935	1.0A fast recovery rectifier

DESIGN EXAMPLES

DDR3 MEMORY POWER SUPPLY

DDR3 Memory Power Supply

Typical Applications: Notebooks, servers, set-top boxes, general high performance/low power applications

This small form factor solution provides the three main supplies (V_{DDQ} , V_{TT} , V_{REF}) for DDR1, DDR2, or DDR3 applications. By simple component changes, this solution can support down to 1.5V V_{DDQ} and 0.75V V_{TT} . The FAN5236 controller with external dual MOSFETs can deliver up to 14A, and by changing the selected MOSFETs, higher currents can be achieved. The three main ICs (controller + 2 dual FETs with integrated Schottky diodes) reduce component count and increase efficiency.

- Wide input voltage range: 5V to 24V
 - Typical DDR3 requirements: 1.5V, 0.5A and 0.75V, 2A output supplies
 - Very low 1 μ A shutdown
 - > 94% overall system efficiency

Product Number	Description
FAN5236	Fairchild DDR/dual output PWM controller
FDMS7700S	Fairchild dual high current MOSFETs with integrated SyncFET™
FDMS7600S	Fairchild dual MOSFETs with integrated SyncFET™
BAT54WT1G	Dual Schottky diode with common cathode

MULTI-OUTPUT DC-DC POWER SUPPLY

Multi-Output DC-DC Power Supply Solution

Typical Applications: Set-top boxes, DVD players, consumer devices

This circuit supports a wide range of output power supplies balancing system efficiency with low component count and cost. The example below provides a complete DC-DC power solution for high volume consumer applications. The FAN5026 dual controllers with discrete dual MLP 5x6 MOSFETs efficiently deliver both the high current 1.0V supply and an intermediate 3.3V supply in conjunction with low dropout linear regulators for the remaining outputs.

- Wide input voltage range (3V to 16V)
- Down to 0.9V and up to 14 amps controller output
- >90% switching regulator overall efficiency
- <10 μ A standby current

Product Number	Description
FAN5026	Fairchild dual output PWM controller
FDMS7700S	Fairchild dual MOSFETs with integrated SyncFET™
FAN1112	Fixed 1.2V output 1A LDO
FAN1582-2.5	Fixed 2.5V output 3A LDO
FAN1616A-1.8	Fixed 1.8V output 500mA LDO
BAT54	Dual Schottky diode with common cathode

DESIGN EXAMPLES

MULTI-PHASE, HIGH CURRENT DC-DC POWER SUPPLY

Multi-Phase High Current DC-DC power supply solution

Typical Applications: Computing desktops, servers, notebooks, blade servers, graphics cards, communication systems

This application demonstrates a high performance, high current multi-phase supply with minimum number of components to deliver up to 90A supply current. It uses the configurable multi-phase FAN5182 controller in conjunction with the integrated DrMOS (FDMF8704) to maximize efficiency and minimize design complexity.

- Programmable 1-, 2-, or 3-phase support with active current balancing
- Wide input voltage range: 7V to 20V
- Externally adjustable output voltages down to 0.8V
- Output current: Up to 32A
- Switching frequency: Up to 1MHz

Product Number	Description
FAN5182	Fairchild multi-phase synchronous controller
FDMF8704	Fairchild FET plus driver multi-chip module

MULTIPLE VOLTAGE SOLUTION FOR FPGAS

Multiple Voltage Solution for FPGAs Using TinyBuck™ Integrated Regulators

Typical Applications: Power supply for Xilinx Virtex 5 or Altera Stratex III FPGAs

This application supports a wide range of demanding FPGA supply needs of high current, low output voltages and power sequencing. Provides 1.0V at 5A for main FPGA core supply with up to 3A continuous current for IO bank support. Each output requires only a 30mm x 30mm package for significant board space savings.

- Wide input voltage range (Up to 24V)
- Multiple output supplies (1.0V 6A, 3.3V 2.5A and 1.8V 1.7A)
- Individual output current limit control
- > 93% system efficiency

Product Number	Description
FAN2106	TinyBuck 6A integrated Buck regulator
FAN2103	TinyBuck 3A integrated Buck regulator
FAN1616A-5	Fixed output 5V, 500mA low drop out linear regulator
1N4148	General purpose diode (10mA/100V)
