### Features

Type	$V_{\text{demag}}^{(1)}$	$R_{\text{DSon}}^{(1)}$	$I_{\text{out}}^{(1)}$	$V_{\text{CC}}$
VNI4140K	$V_{\text{CC}}-41\text{ V}$	$0.08\ \Omega$	0.7 A	41 V

1. Per channel

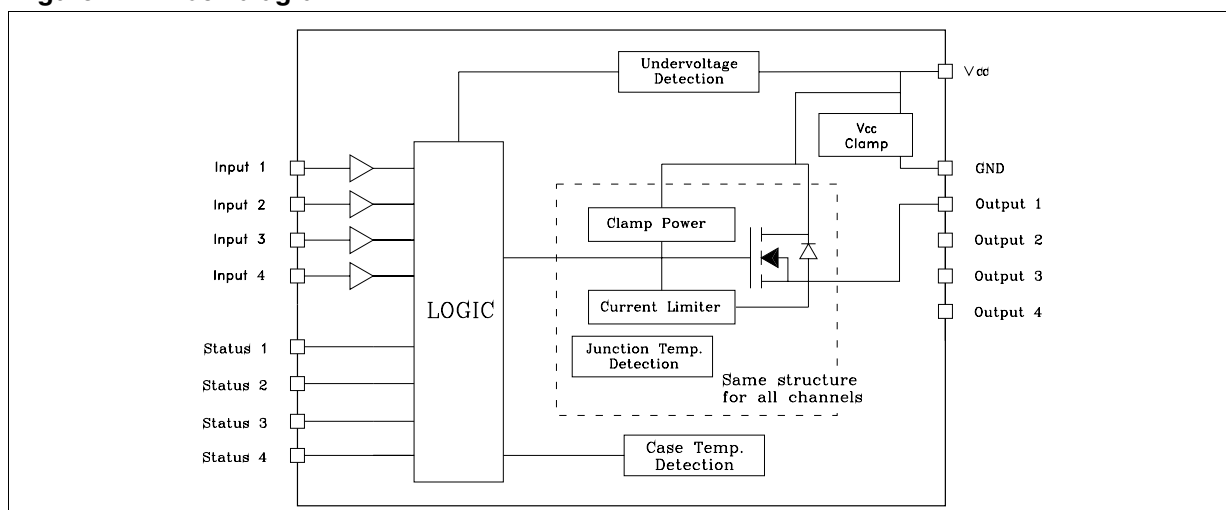

- Output current: 0.7 A per channel
- Shorted load protections
- Junction over-temperature protection
- Case overtemperature protection for thermal independence of the channels
- Thermal case shutdown restart not simultaneous for the various channels
- Protection against loss of ground
- Current limitation
- Undervoltage shutdown
- Open drain diagnostic outputs
- 3.3 V CMOS/TTL compatible inputs
- Fast demagnetization of inductive loads
- Conforms to IEC 61131-2

### Description

The VNI4140K is a monolithic device made using STMicroelectronics VIPower technology, intended for driving four independent resistive or inductive loads with one side connected to ground. Active current limitation avoids dropping the system power supply in case of shorted load. Built-in thermal shutdown protects the chip from overtemperature and short circuit. In overload condition, channel turns OFF and back ON automatically so as to maintain junction temperature between  $T_{\text{TSD}}$  and  $T_{\text{R}}$ . If this condition makes case temperature reach  $T_{\text{CSD}}$ , overloaded channel is turned OFF and will restart only when case temperature has decreased down to  $T_{\text{CR}}$ . In case of more than one channel in overload, re-start of the overloaded channels will not be simultaneous, in order to avoid high peak current from the supply. Non overloaded channels continue to operate normally. The open drain diagnostics outputs indicates over-temperature conditions.

## 9 Reverse polarity protection

A schematic solution to protect the IC against a reverse polarity condition is proposed.

This schematic is effective with any type of load connected to the outputs of the IC.

The  $R_{GND}$  resistor value can be selected according to the following conditions to be met:

1.  $R_{GND} \leq 600 \text{ mV} / (I_S \text{ in ON state max})$ .
2.  $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

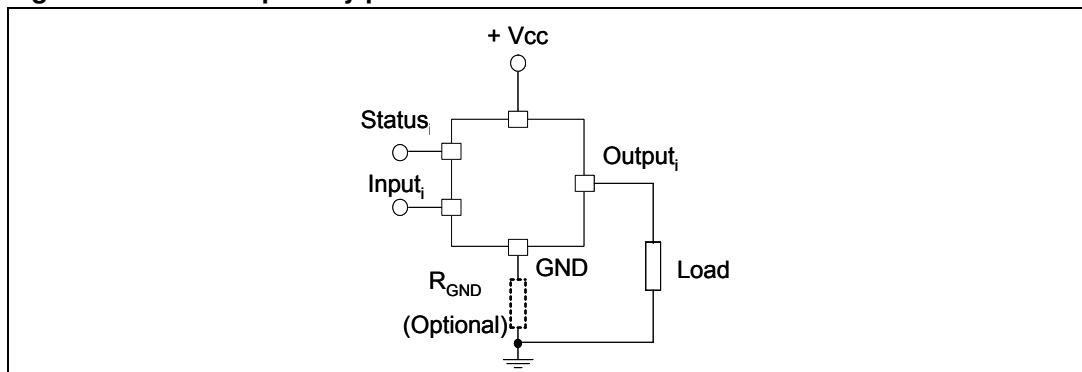

The power dissipation associated to  $R_{GND}$  during reverse polarity condition is:

$$PD = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared by several different ICs. In such case  $I_S$  value on formula (1) is the sum of the maximum ON-state currents of the different devices.

Please note that if the microprocessor ground and the device ground are separated then the voltage drop across the  $R_{GND}$  (given by  $I_S$  in ON state max \*  $R_{GND}$ ) produce a difference between the generated input level and the IC input signal level. This voltage drop will vary depending on how many devices are ON in the case of several high side switches sharing the same  $R_{GND}$ .
