■ APPLICATION NOTE of LD1117/A ADJUSTABLE

The **LD1117/A** adjustable has a reference voltage of between the OUT and ADJ/GND pins. I_{ADJ} is 60μA typ. (120μA max.) and ΔI_{ADJ} is 1μA typ. (5μA max.).

R_1 is normally fixed to 120Ω.

From figure 4 we obtain:

$V_{OUT}=V_{REF}+R_2(I_{ADJ}+I_{R1})=V_{REF} + R_2(I_{ADJ}+V_{REF}/R_1)=V_{REF}(1+R_2/R_1) + R_2 \times I_{ADJ}$.

Usually R_2 value is in the range of few KΩ, so the R_2 X I_{ADJ} product could be neglected; then the above expression becomes: $V_{OUT}=V_{REF}(1+R_2/R_1)$

For better load regulation, realize a good Kelvin connection of R_1 and R_2 is important. Particularly R_1 connection must be realized very close to OUT and ADJ/GND pin, while R_2 ground connection must be placed as near as possible to the negative Load pin. Ripple rejection can be improved by introducing a 10μF electrolytic capacitor placed in parallel to the R_2 resistor (See Fig. 8)
