

FEATURES

- Differential or single-ended voltage DAC output**
- 114 dB DAC dynamic range, A-weighted, differential**
- 97 dB total harmonic distortion plus noise (THD + N), differential**
- 110 dB DAC dynamic range, A-weighted, single-ended**
- 95 dB THD + N, single-ended**
- 2.5 V digital and 3.3 V analog and input/output (I/O) supplies**
- 299 mW total quiescent power**
- Phase-locked loop (PLL) generated or direct master clock**
- Low electromagnetic interference (EMI) design**
- Linear regulator driver to generate digital supply**
- Supports 24-bit and 32 kHz to 192 kHz sample rates**
- Low propagation 192 kHz sample rate mode**
- Log volume control with autoramp function**
- Temperature sensor with digital readout $\pm 3^{\circ}\text{C}$ accuracy**
- SPI and I²C controllable for flexibility**
- Software-controllable clickless mute**
- Software power-down**
- Right justified, left justified, I²S, and TDM modes**
- Master and slave modes with up to 16-channel input/output**
- 80-lead LQFP package**
- Qualified for automotive applications**

APPLICATIONS

- Automotive audio systems
- Home theater systems
- Digital audio effects processors

GENERAL DESCRIPTION

The ADAU1966A is a high performance, single-chip digital-to-analog converter (DAC) that provides 16 DACs with differential or single-ended outputs using the Analog Devices, Inc., patented multibit sigma-delta (Σ - Δ) architecture. A serial peripheral interface (SPI)/I²C port is included, allowing a microcontroller to adjust volume and many other parameters. The ADAU1966A operates from 2.5 V digital and 3.3 V analog supplies. A linear regulator is included to generate the digital supply voltage from the analog supply voltage. The ADAU1966A is available in an 80-lead LQFP.

The ADAU1966A is designed for low EMI. This consideration is apparent in both the system and circuit design architectures. By using the on-board PLL to derive the internal master clock from an external left-right frame clock (LRCLK), the ADAU1966A can eliminate the need for a separate high frequency master clock and can be used with or without a bit clock. The DACs are designed using the latest Analog Devices continuous time architectures to further minimize EMI. By using 2.5 V digital supplies, power consumption is minimized, and the digital waveforms are a smaller amplitude, further reducing emissions.

Note that throughout this data sheet, multifunction pins, such as SCLK/SCL, are referred to by the entire pin name or by a single function of the pin, for example, SCLK, when only that function is relevant.

REVISION HISTORY

3/16—Rev. 0 to Rev. A	
Changes to Table 4.....	5

8/13—Revision 0: Initial Version

SPECIFICATIONS

Performance of all channels is identical, exclusive of the interchannel gain mismatch and interchannel phase deviation specifications. Master clock = 12.288 MHz (48 kHz f_s , $256 \times f_s$ mode), input sample rate = 48 kHz, measurement bandwidth = 20 Hz to 20 kHz, word width = 24 bits, load capacitance (digital output) = 20 pF, load current (digital output) = ± 1 mA or $1.5 \text{ k}\Omega$ to $\frac{1}{2}$ DVDD supply, input voltage high = 2.0 V, input voltage low = 0.8 V, analog audio output resistive load = 3100Ω per pin, unless otherwise noted.

ANALOG PERFORMANCE SPECIFICATIONS: $T_A = 25^\circ\text{C}$

Specifications guaranteed at supply voltages of AVDDx = 3.3 V, DVDD = 2.5 V, ambient temperature¹ (T_A) = 25°C , unless otherwise noted.

Table 1.

Parameter	Test Conditions/Comments	Min	Typ	Max	Unit
DIGITAL-TO-ANALOG CONVERTERS					
Dynamic Range (DNR)	20 Hz to 20 kHz, -60 dB input				
No Filter (RMS)	Differential output	105.5	111		dB

ABSOLUTE MAXIMUM RATINGS

Table 8.

Parameter	Rating
Analog (AVDDx)	-0.3 V to +3.6 V
Input/Output (IOVDD)	-0.3 V to +3.6 V
Digital (DVDD)	-0.3 V to +3.6 V
PLL (PLLVD)	-0.3 V to +3.6 V
VSUPPLY	-0.3 V to +3.6 V
Input Current (Except Supply Pins)	±20 mA
Analog Input Voltage (Signal Pins)	-0.3 V to AVDDx + 0.3 V
Digital Input Voltage (Signal Pins)	-0.3 V to DVDD + 0.3 V
Operating Temperature Range (Case)	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} represents junction-to-ambient thermal resistance, and θ_{JC} represents the junction-to-case thermal resistance. All characteristics are for a 4-layer board with a solid ground plane.

Table 9. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
80-Lead LQFP	42.3	10.0	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

11	DAC16N	O	DAC16 Negative Output.
12	AVDD4	PWR	Analog Power.
13	AGND4	GND	Analog Ground.
14	PLLGND	GND	PLL Ground.
15	LF	O	PLL Loop Filter. Reference the LF pin to PLLVDD.
16	PLLVDD	PWR	PLL Power. Apply 2.5 V to power the PLL.
17	MCLKI/XTALI	I	Master Clock Input/Input to Crystal Inverter. This is a multifunction pin.
18	XTALO	O	Output from Crystal Inverter.
19	MCLKO	O	Master Clock Output.

Pin No.	Mnemonic ^{1,2}	Type ³	Description
20, 29, 41	DVDD	PWR	Digital Power, 2.5 V.
21, 26, 30, 40	DGND	GND	Digital Ground.
22, 39	IOVDD	PWR	Power for Digital Input and Output Pins, 3.3 V.
23	VSENSE	I	2.5 V Regulator Output, Pass Transistor Collector. Bypass VSENSE with a 10 μ F capacitor in parallel with a 100 nF capacitor.
24	VDRIVE	O	Pass Transistor Base Driver.
25	VSUPPLY	I	3.3 V Voltage Regulator Input, Pass Transistor Emitter. Bypass VSUPPLY with a 10 μ F capacitor in parallel with a 100 nF capacitor.
27	DBCLK	I/O	Bit Clock for DACs.
28	DLRCLK	I/O	Frame Clock for DACs.
31	SA1	I	Standalone Mode, Time Domain Multiplexed (SA_MODE TDM) State. See the Standalone Mode section, Table 13, and Table 14, for more information.
32	SA2	I	Standalone Mode, Time Domain Multiplexed (SA_MODE TDM) State. See the Standalone Mode section, Table 13, and Table 14, for more information.
33	DSDATA6	I	DAC11 and DAC 12 Serial Data Input.
34	DSDATA5	I	DAC9 and DAC 10 Serial Data Input.
35	DSDATA4	I	DAC7 and DAC 8 Serial Data Input.
36	DSDATA3	I	DAC5 and DAC 6 Serial Data Input.
37	DSDATA2	I	DAC3 and DAC 4 Serial Data Input.
38	DSDATA1	I	DAC1 and DAC 2 Serial Data Input.
42	MOSI/ADDR1/SA	I	Master Output Slave Input (SPI)/Address 1 (I ² C)/SA_MODE State (see the Standalone Mode section and Table 13).
43	MISO/SDA/SA	I/O	Master Output Slave Input (SPI)/Control Data Input (I ² C)/SA_MODE State (see the Standalone Mode section and Table 13).
44	SCLK/SCL	I	Serial Clock Input (SPI)/Control Clock Input (I ² C).
45	\overline{SS} /ADDR0/SA	I	Slave Select (SPI) (Active Low)/Address 0 (I ² C)/SA_MODE State (see the Standalone Mode section and Table 13).
46	SA_MODE	I	Standalone Mode. This pin allows mode control of ADAU1966A using Pin 42, Pin 43, Pin 45, Pin 31, and Pin 32 (high active). See Table 13 and Table 14 for more information).
47	PU/ \overline{RST}	I	Power-Up/Reset (Active Low). See Power-Up and Reset section for more information.
48	AGND1	GND	Analog Ground.
49	AVDD1	PWR	Analog Power.
50	DAC1P	O	DAC1 Positive Output.
51	DAC1N	O	DAC1 Negative Output.
52	DAC2P	O	DAC2 Positive Output.
53	DAC2N	O	DAC2 Negative Output.
54	DAC3P	O	DAC3 Positive Output.
55	DAC3N	O	DAC3 Negative Output.
56	DAC4P	O	DAC4 Positive Output.
57	DAC4N	O	DAC4 Negative Output.
58	AVDD2	PWR	Analog Power.
59	DAC_BIAS1	I	DAC Bias 1. AC couple Pin 59 with a 470 nF capacitor to AVDD2.
60	DAC_BIAS2	I	DAC Bias 2. AC couple Pin 60 with a 470 nF capacitor to AGND2.
61	AGND2	GND	Analog Ground.
62	CM	O	Common-Mode Reference Filter Capacitor Connection. Bypass the CM pin with a 10 μ F capacitor in parallel with a 100 nF capacitor to AGND2. This reference can be shut off in the PLL_CLK_CTRL1 register (Register 0x01) and the pin can be driven with an outside voltage source.
63	TS_REF	O	Voltage Reference Filter Capacitor Connection. Bypass Pin 63 with a 10 μ F capacitor in parallel with a 100 nF capacitor to AGND2.
64	DAC5P	O	DAC5 Positive Output.
65	DAC5N	O	DAC5 Negative Output.
66	DAC6P	O	DAC6 Positive Output.
67	DAC6N	O	DAC6 Negative Output.
68	DAC7P	O	DAC7 Positive Output.

Pin No.	Mnemonic ^{1,2}	Type ³	Description
69	DAC7N	O	DAC7 Negative Output.
70	DAC8P	O	DAC8 Positive Output.
71	DAC8N	O	DAC8 Negative Output.
72	DAC9P	O	DAC9 Positive Output.
73	DAC9N	O	DAC9 Negative Output.
74	DAC10P	O	DAC10 Positive Output.
75	DAC10N	O	DAC10 Negative Output.
76	DAC11P	O	DAC11 Positive Output.
77	DAC11N	O	DAC11 Negative Output.
78	DAC12P	O	DAC12 Positive Output.
79	DAC12N	O	DAC12 Negative Output.
80	AGND3	GND	Analog Ground.

¹ AVDD1, AVDD2, AVDD3, and AVDD4 are referred to elsewhere in this document as AVDDx when AVDDx means any or all of the AVDD pins.

² DAC Channel 1 to DAC Channel 12 pins are referred to elsewhere in this document as DACx, DACxP, or DACxN when it means any or all of the DAC channel pins.

³ I = input, O = output, I/O = input/output, PWR = power, and GND = ground.

TYPICAL APPLICATION CIRCUITS

Typical application circuits are shown in Figure 8 to Figure 13. Recommended loop filters for DLRCLK and MCLKI/XTALI modes of the PLL reference are shown in Figure 8. Output filters for the DAC outputs are shown in Figure 10 to Figure 13, and an external regulator circuit is shown in Figure 9. When pins for multiple outputs are referred to generically in this datasheet, there is an x in place of the number. For example, DACxP refers to DAC1P through DAC16P.

THEORY OF OPERATION

DACs

The 16 ADAU1966A DAC channels are differential for improved noise and distortion performance and are voltage output for simplified connection. The DACs include on-chip digital interpolation filters with 68 dB stop-band attenuation and linear phase response, operating at an oversampling ratio of 256× (48 kHz range), 128× (96 kHz range), or 64× (192 kHz range). Each channel has its own independently programmable attenuator, adjustable in 255 steps in increments of 0.375 dB. Digital inputs are supplied through six serial data input pins (two channels on each pin), a common frame clock (DLRCLK), and a bit clock (DBCLK). Alternatively, any one of the time domain multiplexed (TDM) modes can be used to access up to 16 channels on a single TDM data line.

The ADAU1966A has a low propagation delay mode; this mode is an option for an f_s of 192 kHz and is enabled in Register DAC_CTRL0[2:1]. By setting these bits to 0b11, the propagation delay is reduced by the amount listed in Table 6. The shorter delay is achieved by reducing the amount of digital filtering; the negative impact of selecting this mode is reduced audio frequency response and increased out-of-band energy.

Because AVDDx is supplied with 3.3 V, each analog output pin has a nominal common-mode (CM) dc level of 1.5 V. With a 0 dB full-scale digital input signal, each pin swings approximately ±1.42 V peak (2.83 V p-p and 2 V rms). Therefore, the voltage swing differentially across the two pins is 5.66 V p-p (4 V rms). The differential analog outputs require a single-order passive differential resistor-capacitor (RC) filter only to provide the specified DNR performance; see Figure 10 or Figure 11 for an example filter. The outputs can easily drive differential inputs on a separate printed circuit board (PCB) through cabling as well as differential inputs on the same PCB.

If more signal level is required, or if a more robust filter is needed, a single op amp gain stage designed as a second-order, low-pass Bessel filter can be used to remove the high frequency out-of-band noise present on each pin of the differential outputs. The choice of components and design of this circuit is critical to yield the full DNR of the DACs (see the recommended passive and active circuits in Figure 10, Figure 11, Figure 12, and Figure 13). The differential filter can be built into an active difference amplifier to provide a single-ended output with gain, if necessary. Note that the use of op amps with low slew rate or low bandwidth can cause high frequency noise and tones to fold down into the audio band; exercise care when selecting these components.

The ADAU1966A offers control over the analog performance of the DACs; it is possible to program the registers to reduce the

power consumption with the trade-off of lower SNR and THD + N. The reduced power consumption is the result of changing the internal bias current to the analog output amplifiers.

Register DAC_POWER1 to Register DAC_POWER4 present four basic settings for the DAC power vs. performance in each of the 16 channels: best performance, good performance, low power, and lowest power. Alternatively, in Register PLL_CLK_CTRL1[7:6], the LOPWR_MODE bits offer global control over the power and performance for all 16 channels. To select the low power or lowest power settings, set Bit 7 and Bit 6 of the DAC_POWERx registers to 0b10 or 0b11, respectively. The default setting is 0b00. This setting allows the channels to be controlled individually using the DAC_POWERx registers. The data presented in Table 11 shows the result of setting all 16 channels to each of the four settings. The SNR and THD + N specifications are shown in relation to the measured performance of a device at the best performance setting.

The voltage at CM, the common-mode reference pin, can be used to bias the external op amps that buffer the output signals (see the Power Supply and Voltage Reference section).

CLOCK SIGNALS

Upon powering the ADAU1966A and asserting the PU/RST pin high, the part starts in either standalone mode (SA_MODE) or program mode, depending on the state of SA_MODE (Pin 46). The clock functionality of SA_MODE is described in the Standalone Mode section.

In program mode, the default for the ADAU1966A is for the MCLKO pin to feed a buffered output of the MCLKI signal on the MCLKI/XTALI pin. The default for the DLRCLK and DBCLK ports is slave mode; the DAC must be driven with a coherent set of master clock, frame clock, and bit clock signals to function.

The MCLKO pin can be programmed to provide different clock signals using Register PLL_CLK_CTRL1[5:4]. The default, 0b10, provides a buffered copy of the clock signal that is driving the MCLKI pin. Two modes, 0b00 and 0b01, provide low jitter clock signals.

The b00 setting yields a clock rate between 4 MHz and 6 MHz, and the b01 setting yields a clock rate between 8 MHz and 12 MHz. Both of these clock frequencies are scaled as ratios of the master clock automatically inside the ADAU1966A. As an example, an input to MCLKI of 8.192 MHz and a setting of 0b00 yield an MCLKO of $(8.192/2) = 4.096$ MHz. Alternatively, an input to MCLKI of 36.864 MHz and a setting of 0b01 yield an MCLKO frequency of $(36.864/3) = 12.288$ MHz. The 0b11 setting disables the MCLKO pin.

Table 11. DAC Power vs. Performance

Register Setting	Best Performance	Good Performance	Low Power	Lowest Power
Total AVDDx Current	60 mA	53 mA	47 mA	40 mA
SNR	Reference	-0.2 dB	-1.5 dB	-14.2 dB
THD + N (-1 dBFS Signal)	Reference	-1.8 dB	-3.0 dB	-5.8 dB

After the $\overline{\text{PU/RST}}$ pin is asserted high, the PLL_CLK_CTRLx registers (Register 0x00 and Register 0x01) can be programmed. The on-chip PLL can be selected to use the clock appearing at the MCLKI/XTALI pin at a frequency of 256, 384, 512, or 768 times the sample rate (f_s), referenced to the 48 kHz mode from the master clock select (MCS) setting, as described in Table 12.

In 96 kHz mode, the master clock frequency stays at the same absolute frequency; therefore, the actual multiplication rate is divided by 2. In 192 kHz mode, the actual multiplication rate is divided by 4.

For example, if the ADAU1966A is programmed in $256 \times f_s$ mode, the frequency of the master clock input is $256 \times 48 \text{ kHz} = 12.288 \text{ MHz}$. If the ADAU1966A is then switched to 96 kHz operation (by writing to DAC_CTRL0[2:1]), the frequency of the master clock remains at 12.288 MHz, which is an MCS ratio of $128 \times f_s$ in this example. Therefore, in 192 kHz mode, MCS becomes $64 \times f_s$. The internal clock for the digital core varies by mode: $512 \times f_s$ (48 kHz mode), $256 \times f_s$ (96 kHz mode), or $128 \times f_s$ (192 kHz mode). By default, the on-board PLL generates this internal master clock from an external clock.

The PLL must be powered and stable before using the ADAU1966A as a source for quality audio. The PLL is enabled by reset and does not require writing to the I²C or SPI port for normal operation.

With the PLL enabled, the performance of the ADAU1966A is not affected by jitter as high as a 300 ps rms time interval error

(TIE). When the internal PLL is disabled, use an independent crystal oscillator to generate the master clock.

When using the ADAU1966A in direct master clock mode, power down the PLL in the PDN_THRMSSENS_CTRL_1 register. For direct master clock mode, a frequency of $512 \times f_s$ (referenced to 48 kHz mode) must be fed into the MCLKI pin, and the CLK_SEL bit in the PLL_CLK_CTRL1 register must be set to 1. However, for the device to function, 2.5 V power must be connected to the PLLVDD pin.

The PLL of the ADAU1966A can also be programmed to run from an external LRCLK without an external master clock. Setting the PLLIN bits in the PLL_CLK_CTRL0 register to 0b01 and connecting the appropriate loop filter to the LF pin (see Figure 8), the ADAU1966A PLL generates all of the necessary internal clocks for operation with no external master clock. This mode reduces the number of high frequency signals in the design, reducing EMI emissions.

It is possible to further reduce EMI emissions of the circuit by using the internal bit clock generation setting of the BCLK_GEN bit in the DAC_CTRL1 register. Setting the BCLK_GEN bit to 1 (internal) and the SAI_MS bit to 0 (slave), the ADAU1966A generates its own bit clock; this configuration works with the PLL input register (PLL_CLK_CTRL0[7:6]) set to either MCLKI/XTALI or DLCLK. The clock on the DLCLK pin is the only required clock in DLCLK PLL mode.

Table 12. MCS and f_s Modes

Frequency Sample Select DAC_CTRL0[2:1]		Master Clock Select (MCS), PLL_CLK_CTRL0[2:1]							
		Setting 0, 0b00		Setting 1, 0b01		Setting 2, 0b10		Setting 3, 0b11	
f_s (kHz)	Bit Setting	Ratio	Master Clock (MHz)	Ratio	Master Clock (MHz)	Ratio	Master Clock (MHz)	Ratio	Master Clock (MHz)
32 kHz,	0b00	$256 \times f_s$	8.192	$384 \times f_s$	12.288	$512 \times f_s$	16.384	$768 \times f_s$	24.576

176.4 kHz	0b10 or 0b11	$64 \times f_s$	11.2896	$96 \times f_s$	16.9344	$128 \times f_s$	22.5792	$192 \times f_s$	33.8688
192 kHz	0b10 or 0b11	$64 \times f_s$	12.288	$96 \times f_s$	18.432	$128 \times f_s$	24.576	$192 \times f_s$	36.864

POWER-UP AND RESET

The power sequencing for the ADAU1966A begins with AVDDx and IOVDD, followed by DVDD. It is very important that AVDDx be settled at a regulated voltage and that IOVDD be within 10% of regulated voltage before applying DVDD. When using the internal regulator of the ADAU1966A, this timing occurs by default.

To guarantee proper startup, pull the PU/RST pin low by an external resistor and then drive it high after the power supplies have stabilized. The PU/RST can also be pulled high using a simple RC network.

Driving the PU/RST pin low puts the part into a very low power state (<3 µA). All functionality of the ADAU1966A is disabled until the PU/RST pin is asserted high. Once this pin is asserted high, the ADAU1966A requires 300 ms to stabilize. The MMUTE bit in the DAC_CTRL0 register must be toggled for operation.

The PUP (master power-up control) bit in the PLL_CLK_CTRL0 register can be used to power down the ADAU1966A. Setting the PUP bit to 0 puts the ADAU1966A in an idle state while maintaining the settings of all registers. Additionally, the power-down bits in the PDN_THRMSSENS_CTRL_1 register (TS_PDN, PLL_PDN, and VREG_PDN) can be used to power down individual sections of the ADAU1966A.

The SOFT_RST bit in the PLL_CLK_CTRL0 register sets all of the control registers to their default settings while maintaining the internal clocks in default mode. The SOFT_RST bit does not power down the analog outputs; nor does toggling this bit cause audible popping sounds at the differential analog outputs.

For proper startup of the ADAU1966A, follow these steps:

1. Apply power to the ADAU1966A as described previously in this Power-Up and Reset section.
2. Assert the PU/RST pin high after power supplies are stable.
3. Set the PUP bit to 1.
4. Program all necessary registers for the desired settings.
5. Set the MMUTE bit to 0 to unmute all channels.

STANDALONE MODE

The ADAU1966A can operate without a typical I²C or SPI connection to a microcontroller. This standalone mode is available by setting SA_MODE (Pin 46) to IOVDD. All registers are set to default except for the options shown in Table 13.

Table 13. SA_MODE Settings

Pin No.	Setting	Function
42	0	Master mode serial audio interface (SAI)
	1	Slave mode SAI
43	0	MCLK = 256 × f _s , PLL on
	1	MCLK = 384 × f _s , PLL on
45	0	I ² S SAI format
	1	TDM modes, determined by Pin 31 and Pin 32

When both SA_MODE (Pin 46) and SS/ADDR0/SA (Pin 45) are set high, TDM mode is selected. Table 14 shows the available TDM modes; these modes are set by connecting Pin 31 (SA1) and Pin 32 (SA2) to GND or IOVDD.

Table 14. TDM Modes

Pin No.	Setting	Function
31 to 32	00	TDM4, DLRCLK pulse
	01	TDM8, DLRCLK pulse
	10	TDM16, DLRCLK pulse
	11	TDM8, DLRCLK 50% duty cycle

By powering up the ADAU1966A in SA_MODE, and asserting the PU/RST pin high, the MCLKO pin provides a buffered version of the MCLKI/XTALI pin, whether the source is a crystal or an active oscillator.

I²C CONTROL PORT

The ADAU1966A has an I²C-compatible control port that permits programming and readback of the internal control registers for the DACs and clock system. The I²C interface of the ADAU1966A is a 2-wire interface consisting of a clock line, SCL, and a data line, SDA. SDA is bidirectional, and the ADAU1966A drives SDA either to acknowledge the master (ACK) or to send data during a read operation. The SDA pin (MISO/SDA/SA) for the I²C port is an open-drain collector and requires a 2 kΩ pull-up resistor. A write or read access occurs when the SDA line is pulled low while the SCL line (SCLK/SCL) is high, indicated by a start in Figure 14 and Figure 15.

SDA is only allowed to change when SCL is low, except when a start or stop condition occurs, as shown in Figure 14 and Figure 15. The first eight bits of the data-word consist of the device address and the R/W bit. The device address consists of an internal built-in address (0x04) and two address bits, ADDR1 and ADDR0. The two address bits allow four ADAU1966A devices to be used in a system.

Table 15. I²C Addresses

ADDR1 (AD1)	ADDR0 (AD0)	Slave Address
0	0	0x04
0	1	0x24
1	0	0x44
1	1	0x64

I²C Write

Initiating a write operation to the ADAU1966A involves the following steps (see Figure 14):

1. Send a start condition
2. Send the device address with the $\overline{R/\overline{W}}$ bit set low.
 - a. The ADAU1966A responds by issuing an acknowledge to indicate that it has been addressed.
3. Send a second frame directing the ADAU1966A to which register is required to be written.
 - a. A second acknowledge is issued by the ADAU1966A.
4. Send a third frame with the eight data bits required to be written to the register.
 - a. A third acknowledge is issued by the ADAU1966A.
5. Send a stop condition to complete the data transfer.

Figure 14. I²C Write Format

Table 16. I²C Abbreviations

Abbreviation	Condition
S	Start bit

I²C Read

A read operation requires that the user first write to the ADAU1966A to point to the correct register and then read the data. The following steps achieve this (see Figure 15):

1. Send a start condition followed by the device address frame with the R/W bit low and then the register address frame.
 - a. The ADAU1966A responds with an acknowledge.
2. Issue a repeated start condition.
 - a. The next frame is the device address with the R/W bit set high.
 - b. On the next frame, the ADAU1966A outputs the register data on the SDA line.
3. Issue a stop condition to complete the read operation.

Table 19. Single Word I²C Read

1128B-015

SERIAL CONTROL PORT: SPI CONTROL MODE

The ADAU1966A has a 4-wire SPI control port that permits the programming and reading back of the internal control registers for the DACs and clock system. A standalone mode is also available for operation without serial control; it is configured at reset using the SA_MODE pin. See the Standalone Mode section for details about the SA_MODE pin.

By default, the ADAU1966A is in I²C mode; however, it can be put into SPI control mode by pulling \overline{SS} low three times. This is done by performing three dummy writes to the SPI port (the ADAU1966A does not acknowledge these three writes, see Figure 16). Beginning with the fourth SPI write, data can be written to or read from the IC. The ADAU1966A can only be taken out of SPI control mode by a full reset initiated by power cycling the device.

The format is a 24-bit wide data-word. The serial bit clock and latch can be completely asynchronous to the sample rate of the DACs. The first byte is a global address with a read/write bit. For the ADAU1966A, the address is 0x06, shifted left one bit due to the R/ \overline{W} bit. The second byte is the ADAU1966A register address, and the third byte is the data, as shown in Figure 17 and Figure 18. When reading data from the ADAU1966A, MISO is tristated until the third byte where it drives data out (see Figure 18). MISO is tristated at all other times, allowing it to be bused with other devices. The timing requirements are shown in Figure 19.

Figure 16. SPI Mode Initial Sequence

Figure 17. SPI Write to ADAU1966A Clocking

Figure 18. SPI Read from ADAU1966A Clocking

Figure 19. SPI Signal Timing

Chip Address $\overline{R/\overline{W}}$

The LSB of the first byte of an SPI transaction is a $\overline{R/\overline{W}}$ bit. This bit determines whether the communication is a read (Logic Level 1) or a write (Logic Level 0). This format is shown in Table 21.

Table 21. ADAU1966A SPI Address and $\overline{R/\overline{W}}$ Byte Format

Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
0	0	0	0	1	1	0	$\overline{R/\overline{W}}$

SPI Burst Read/Write

The SPI port is capable of performing burst reads or writes by sending the chip address byte with the $\overline{R/\overline{W}}$ bit followed by the first register address that needs to be read from or written to. Then, as long as the \overline{SS} pin is held low, the user can sequentially read from or write to the registers by continuing to send clock pulses into the SCLK pin. An efficient way to initialize the ADAU1966A is by

- Sending out the address byte with the $\overline{R/\overline{W}}$ bit low (write)
- Sending out the address of the first register
- Sending out all the register byte values
- Toggling \overline{SS} to end the transfer
- Performing a burst read to verify that the register writes were successful

When referencing back to Analog Devices legacy devices, different pin names (mnemonics) were used for these SPI port functions. See Table 22 for details of the changes.

Table 22. SPI Port Pin Naming Conventions

Pin No.	Legacy Pin Mnemonic	New Pin Mnemonic
42	CDATA	MOSI
43	COU \overline{T}	MISO
44	CCLK	SCLK
45	\overline{CLATCH}	\overline{SS}

POWER SUPPLY AND VOLTAGE REFERENCE

The ADAU1966A is designed for 3.3 V analog and 2.5 V digital supplies. To minimize noise pickup, bypass the power supply pins with 100 nF ceramic chip capacitors placed as close to the pins as possible. Provide a bulk aluminum electrolytic capacitor of at least 22 μ F for each rail on the same PCB as the codec. It is important that the analog supply be as clean as possible.

The ADAU1966A includes a 2.5 V regulator driver that requires only an external pass transistor and bypass capacitors to make a 2.5 V regulator from a 3.3 V supply. Decouple the VSUPPLY and VSENSE pins with no more than 10 μ F of capacitance in parallel with 100 nF high frequency bypassing. If the regulator driver is not used, connect VSUPPLY and VDRIVE to GND and leave VSENSE unconnected.

The temperature sensor internal voltage reference (V_{TS_REF}) is connected to the TS_REF pin and must be bypassed as close as possible to the chip with a parallel combination of 10 μ F and 100 nF capacitors.

The internal band gap reference can be disabled in the PLL_CLK_CTRL1 register by setting VREF_EN to 0; the CM pin can be then be driven from an external source. This can be used to scale the DAC output to the clipping level of a power amplifier based on its power supply voltage.

The CM pin is the internal common-mode reference. Bypass it as close as possible to the chip with a parallel combination of 10 μ F and 100 nF capacitors. This voltage can be used to bias external op amps to the common-mode voltage of the analog input and output signal pins. It is recommended that the CM pin be isolated from the external circuitry by using a high quality buffer to provide a quiet, low impedance source for the external circuitry. Use of a quiet op amp is critical because any noise added to the reference voltage is injected into the signal path.

SERIAL DATA PORTS—DATA FORMAT

The 16 DAC channels use a common serial bit clock (DBCLK) and a common left-right framing clock (DLRCLK) in the serial data port. The clock signals are all synchronous with the sample rate. The normal stereo serial modes are shown in Figure 20.

The DAC serial data mode defaults to I²S (1 BCLK delay) upon power-up and reset. The ports can also be programmed for left justified and right justified (24-bit and 16-bit) operation using DAC_CTRL0[7:6]. Stereo and TDM modes can be selected using DAC_CTRL0[5:3]. The polarity of DBCLK and DLRCLK is programmable according to the DAC_CTRL1[1] and DAC_CTRL1[5] bits. The serial ports are programmable as the clock masters according to the DAC_CTRL1[0] bit. By default, the serial port is in slave mode.

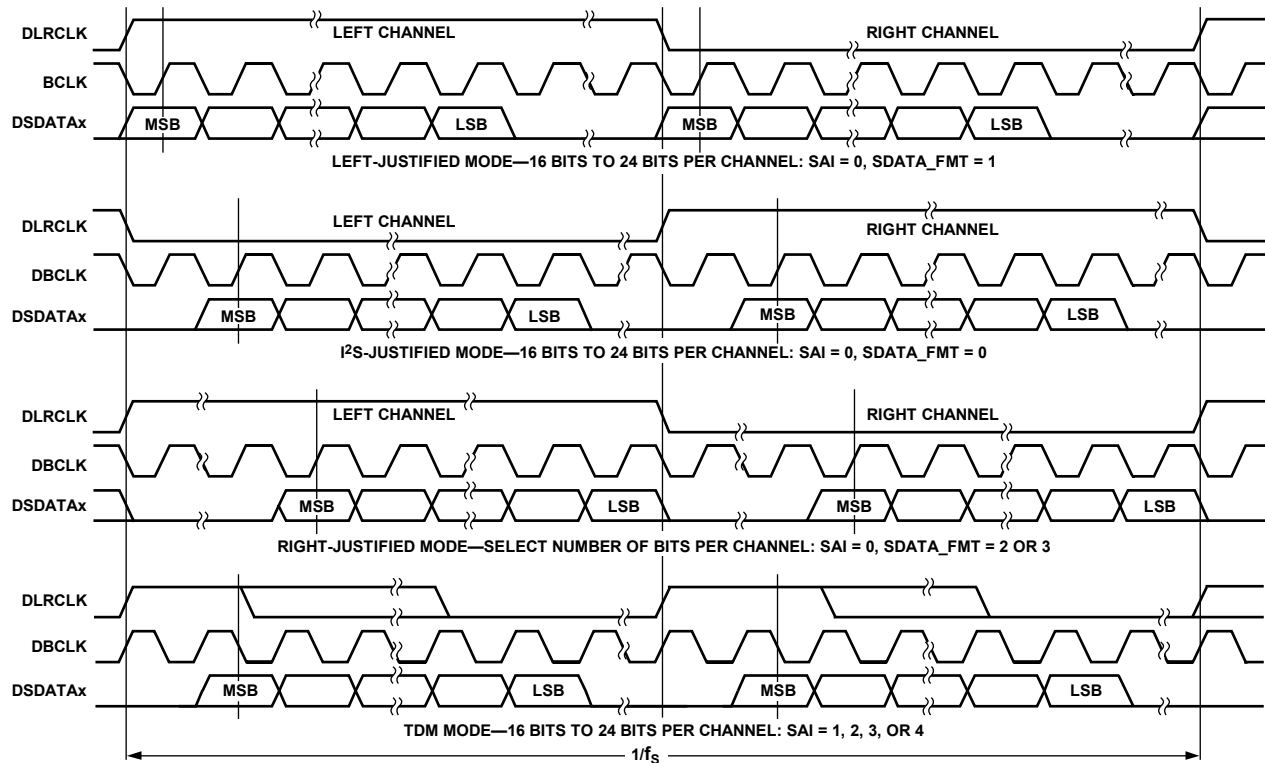

Figure 20. Stereo Serial Audio Modes

11371-020

TIME-DIVISION MULTIPLEXED (TDM) MODES

The ADAU1966A serial ports also have several different TDM serial data modes. The ADAU1966A can support a single data line (TDM16), a dual data line (TDM8), a quad data line (TDM4), or eight data lines (TDM2). The DLRCLK/frame clock can operate in both single-cycle pulse mode and a 50% duty cycle mode. Both 16 DBCLKs and 32 DBCLKs per channel are selectable for each mode.

The I/O pins of the serial ports are defined according to the serial mode that is selected. For a detailed description of the function of each pin in TDM and stereo modes, see Table 23.

TEMPERATURE SENSOR

The ADAU1966A has an on-board temperature sensor that allows the user to read the temperature of the silicon inside the device. The temperature sensor readout has a range of -60°C to $+140^{\circ}\text{C}$ in 1°C steps. The PDN_THRMSSENS_CTRL_1 register controls the settings of the sensor. The temperature sensor is powered on by default and can be shut off by setting the TS_PDN[2] bit to 1 in the

PDN_THRMSSENS_CTRL_1 register. The temperature sensor can be run in either continuous operation or one-shot mode. The temperature sensor conversion mode is modified using THRМ_MODE (Bit 5); the default is THRМ_MODE = 1, one-shot mode. In one-shot mode, writing a 0 followed by writing a 1 to THRМ_GO (Bit 4), results in a single reset and temperature conversion, placing the resulting temperature data in the THRМ_TEMP_STAT register.

In continuous operation mode, the data conversion takes place at a rate set by THRМ_RATE[7:6], with a range of 0.5 sec to 4 sec between samples. Faster rates are possible using one-shot mode.

Once a temperature conversion is placed in the THRМ_TEMP_STAT register, the data can be translated into degrees Celsius ($^{\circ}\text{C}$) using the following steps:

1. Convert the binary or hexadecimal data read from THRМ_TEMP_STAT into decimal form.
2. Subtract 60 from the converted THRМ_TEMP_STAT data; this is the temperature of the silicon in $^{\circ}\text{C}$.

Figure 21. DAC Serial Timing

Table 23. Pin Function Changes in Different Serial Audio Interface Modes

Signal	Stereo Modes (SAI = 0 or SAI = 1)	TDM4 Mode (SAI = 2)	TDM8 Mode (SAI = 3)	TDM16 Mode (SAI = 4)
DSDATA1	Channel 1/Channel 2 data input	Channel 1 to Channel 4 data input	Channel 1 to Channel 8 data input	Channel 1 to Channel 16 data input
DSDATA2	Channel 3/Channel 4 data input	Channel 5 to Channel 8 data input	Channel 9 to Channel 16 data input	Not used
DSDATA3	Channel 5/Channel 6 data input	Channel 9 to Channel 12 data input	Not used	Not used
DSDATA4	Channel 7/Channel 8 data input	Channel 13 to Channel 16 data input	Not used	Not used
DSDATA5	Channel 9/Channel 10 data input	Not used	Not used	Not used
DSDATA6	Channel 11/Channel 12 data input	Not used	Not used	Not used
DSDATA7	Channel 13/Channel 14 data input	Not used	Not used	Not used
DSDATA8	Channel 15/Channel 16 data input	Not used	Not used	Not used
DLRCLK	DLRCLK input/DLRCLK output	TDM frame sync input/ TDM frame sync output	TDM frame sync input/ TDM frame sync output	TDM frame sync input/ TDM frame sync output
DBCLK	DBCLK input/DBCLK output	TDM DBCLK input/ TDM DBCLK output	TDM DBCLK input/ TDM DBCLK output	TDM DBCLK input/ TDM DBCLK output
Maximum Sample Rate	192 kHz	192 kHz	96 kHz	48 kHz

ADDITIONAL MODES

The ADAU1966A offers several additional modes for board level design enhancements. To reduce the EMI in board level design, serial data can be transmitted without an explicit bit clock input on the DBCLK pin. See Figure 22 for an example of a DAC TDM data transmission mode that does not require a high speed bit clock or an external master clock. This configuration is applicable when the ADAU1966A master clock is generated by the PLL with the DLRCLK pin as the PLL reference frequency.

To relax the requirement for the setup time of the ADAU1966A in cases of high speed TDM data transmission, the ADAU1966A can latch in the data using the falling edge of DBCLK pin; see the BCLK_EDGE bit in the DAC_CTRL1 register. This effectively dedicates the entire bit clock period to the setup time. This mode is useful when the source has a large delay time in the serial data driver. Figure 23 shows this inverted bit clock mode of data transmission.

Figure 22. Serial DAC Data Transmission in TDM Format Without DBCLK (Applicable Only If PLL Locks to DLRCLK)

Figure 23. Inverted DBCLK Mode in DAC Serial Data Transmission (Applicable in Stereo and TDM, Useful for High Frequency TDM Transmission)

REGISTER DETAILS

PLL AND CLOCK CONTROL 0 REGISTER

Address: 0x00, Reset: 0x00, Name: PLL_CLK_CTRL0

Table 25. Bit Descriptions for PLL_CLK_CTRL0

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	PLLIN	00 01 10 11	PLL Input Select. Selects between MCLKI/XTALI and DLRCLK as the input to the PLL. MCLKI or XTALI. DLRCLK. Reserved. Reserved.	0x0	RW
[5:4]	XTAL_SET	00 01 10 11	XTAL Oscillator Setting. XTALO pin status. XTAL oscillator enabled. Reserved. Reserved. XTALO Off.	0x0	RW
3	SOFT_RST	0 1	Software Reset Control. This bit resets all circuitry inside the IC, except I ² C/SPI communications. All control registers are reset to default values, except Register 0x00 and Register 0x01. The PLL_CLK_CTRLx registers do not change state. Normal Operation. Device in Reset.	0x0	RW
[2:1]	MCS	00 01 10 11	Master Clock Select. MCLKI/XTALI pin functionality (PLL active), master clock rate setting. The following values are for the f_s rate range from 32 kHz to 48 kHz. See Table 12 for details when using other f_s selections. $256 \times f_s$ MCLK (44.1 kHz or 48 kHz). $384 \times f_s$ MCLK (44.1 kHz or 48 kHz). $512 \times f_s$ MCLK (44.1 kHz or 48 kHz). $768 \times f_s$ MCLK (44.1 kHz or 48 kHz).	0x0	RW
0	PUP	0 1	Master Power-Up Control. This bit must be set to 1 as the first register write to power up the IC. Master Power-Down. Master Power-Up.	0x0	RW

PLL AND CLOCK CONTROL 1 REGISTER

Address: 0x01, Reset: 0x2A, Name: PLL_CLK_CTRL1

Table 26. Bit Descriptions for PLL_CLK_CTRL1

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	LOPWR_MODE	00 01 10 11	Global Power/Performance Adjust. These bits adjust the power consumption and performance level for all 16 DAC channels at once. See the DACs section for more details. I ² C Register Settings. Reserved. Lower Power. Lowest Power.	0x0	RW
[5:4]	MCLKO_SEL	00 01 10 11	MCLK Output Frequency. Frequency selection for MCLKO pin. See the Clock Signals section for more details. MCLKO = 4 MHz to 6 MHz scaled by f _s . MCLKO = 8 MHz to 12 MHz scaled by f _s . MCLKO = Buffered MCLKI. MCLKO Pin Disabled.	0x2	RW
3	PLL_MUTE	0 1	PLL Automute Enable/Lock. This bit enables the PLL lock automute function. No DAC Automute. DAC Automute on PLL Unlock.	0x1	RW
2	PLL_LOCK	0 1	PLL Lock Indicator. PLL Not Locked. PLL Locked.	0x0	R
1	VREF_EN	0 1	Internal Voltage Reference Enable. The internal voltage reference powers the common mode for the ADAU1966A. Disabling this bit allows the user to drive the CM pin with an outside voltage source. Disabled. Enabled.	0x1	RW
0	CLK_SEL	0 1	DAC Clock Select. Selects between PLL and direct MCLK mode. MCLK from PLL. MCLK from MCLKI or XTALI.	0x0	RW

BLOCK POWER-DOWN AND THERMAL SENSOR CONTROL 1 REGISTER

Address: 0x02, Reset: 0xA0, Name: PDN_THRMSSENS_CTRL_1

Table 27. Bit Descriptions for PDN_THRMSSENS_CTRL_1

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	THRM_RATE	00 01 10 11	Conversion Time Interval. When THRM_MODE = 0, the THRM_RATE bits control the time interval between temperature conversions. 4 sec/Conversion. 0.5 sec/Conversion. 1 sec/Conversion. 2 sec/Conversion.	0x2	RW
5	THRM_MODE	0 1	Continuous vs. One-Shot. Determines if the temperature conversions occur continuously or only when commanded. To perform one-shot temperature conversions, set this bit to 1. Continuous Operation. One-Shot Mode.	0x1	RW
4	THRM_GO	0 1	One-Shot Conversion Mode. When in one-shot conversion mode, THRM_MODE = 1, the THRM_GO bit must be set to 0 followed by a write of 1. This sequence results in a single temperature conversion. The temperature data is available 120 ms after writing a 1 to this bit. Reset. Convert Temperature.	0x0	RW
2	TS_PDN	0 1	Temperature Sensor Power-Down. Temperature Sensor On. Temperature Sensor Power-Down.	0x0	RW
1	PLL_PDN	0 1	PLL Power-Down. PLL Normal Operation. PLL Power-Down.	0x0	RW
0	VREG_PDN	0 1	Voltage Regulator Power-Down. Voltage Regulator Normal Operation. Voltage Regulator Power-Down.	0x0	RW

POWER-DOWN CONTROL 2 REGISTER

Address: 0x03, Reset: 0x00, Name: PDN_CTRL2

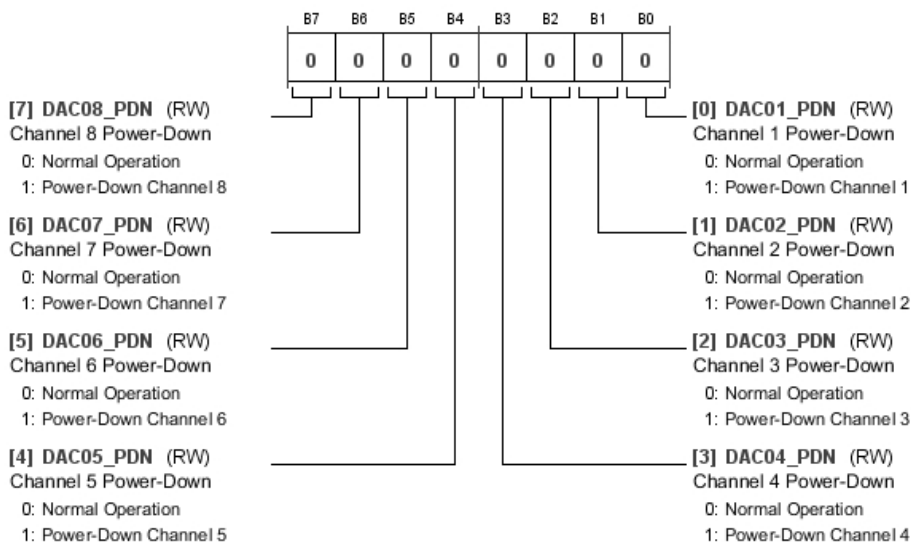

Table 28. Bit Descriptions for PDN_CTRL2

Bits	Bit Name	Settings	Description	Reset	Access
7	DAC08_PDN	0 1	Channel 8 Power-Down Normal Operation Power-Down Channel 8	0x0	RW
6	DAC07_PDN	0 1	Channel 7 Power-Down Normal Operation Power-Down Channel 7	0x0	RW
5	DAC06_PDN	0 1	Channel 6 Power-Down Normal Operation Power-Down Channel 6	0x0	RW
4	DAC05_PDN	0 1	Channel 5 Power-Down Normal Operation Power-Down Channel 5	0x0	RW
3	DAC04_PDN	0 1	Channel 4 Power-Down Normal Operation Power-Down Channel 4	0x0	RW
2	DAC03_PDN	0 1	Channel 3 Power-Down Normal Operation Power-Down Channel 3	0x0	RW
1	DAC02_PDN	0 1	Channel 2 Power-Down Normal Operation Power-Down Channel 2	0x0	RW
0	DAC01_PDN	0 1	Channel 1 Power-Down Normal Operation Power-Down Channel 1	0x0	RW

POWER-DOWN CONTROL 3 REGISTER

Address: 0x04, Reset: 0x00, Name: PDN_CTRL3

Table 29. Bit Descriptions for PDN_CTRL3

Bits	Bit Name	Settings	Description	Reset	Access
7	DAC16_PDN	0 1	Channel 16 Power-Down Normal Operation Power-Down Channel 16	0x0	RW
6	DAC15_PDN	0 1	Channel 15 Power-Down Normal Operation Power-Down Channel 15	0x0	RW
5	DAC14_PDN	0 1	Channel 14 Power-Down. Normal Operation Power-Down Channel 14	0x0	RW
4	DAC13_PDN	0 1	Channel 13 Power-Down. Normal Operation Power-Down Channel 13	0x0	RW
3	DAC12_PDN	0 1	Channel 12 Power-Down Normal Operation Power-Down Channel 12	0x0	RW
2	DAC11_PDN	0 1	Channel 11 Power-Down Normal Operation Power-Down Channel 11	0x0	RW
1	DAC10_PDN	0 1	Channel 10 Power-Down Normal Operation Power-Down Channel 10	0x0	RW
0	DAC09_PDN	0 1	Channel 9 Power-Down Normal Operation Power-Down Channel 9	0x0	RW

THERMAL SENSOR TEMPERATURE READOUT REGISTER

Address: 0x05, Reset: 0x00, Name: THRM_TEMP_STAT

Table 30. Bit Descriptions for THRM_TEMP_STAT

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	TEMP		Thermal Sensor Temperature Readout. –60°C to +140°C range, 1°C step size. To convert the hexadecimal or binary TEMP value into decimal form, use the following equation: (TEMP – 60). The result is the temperature in degrees Celsius.	0x00	R

DAC CONTROL 0 REGISTER

Address: 0x06, Reset: 0x01, Name: DAC_CTRL0

Table 31. Bit Descriptions for DAC_CTRL0

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	SDATA_FMT	00 01 10 11	SDATA Format. Only used when SAI = 000. I ² S, 1 BCLK Cycle Delay. Left Justified, 0 BCLK Cycle Delay. Right Justified, 24-Bit Data, 8 BCLK Cycle Delay. Right Justified, 16-Bit Data, 16 BCLK Cycle Delay.	0x0	RW
[5:3]	SAI	000 001 010 011 100 101 110 111	Serial Audio Interface. When SAI = 000, the SDATA_FMT bits control stereo SDATA format. Stereo (I ² S, LJ, RJ). TDM2—Octal Line. TDM4—Quad Line. TDM8—Dual Line. TDM16—Single Line (48 kHz). Reserved. Reserved. Reserved.	0x0	RW

Bits	Bit Name	Settings	Description	Reset	Access
[2:1]	FS	00 01 10 11	Sample Rate Select. 32 kHz/44.1 kHz/48 kHz. 64 kHz/88.2 kHz/96 kHz. 128 kHz/176.4 kHz/192 kHz. 128 kHz/176.4 kHz/192 kHz Low Propagation Delay.	0x0	RW
0	MMUTE	0 1	DAC Master Mute. Normal Operation. All Channels Muted.	0x1	RW

DAC CONTROL 1 REGISTER

Address: 0x07, Reset: 0x00, Name: DAC_CTRL1

Table 32. Bit Descriptions for DAC_CTRL1

Bits	Bit Name	Settings	Description	Reset	Access
7	BCLK_GEN	0 1	DBCLK Generation. When the PLL is locked to DLRCLK, it is possible to run the ADAU1966A without an external DBCLK. Normal Operation—DBCLK. Internal DBCLK Generation.	0x0	RW
6	LRCLK_MODE	0 1	DLRCLK Mode Select. Only Valid for TDM modes. 50% Duty Cycle DLRCLK. Pulse Mode.	0x0	RW
5	LRCLK_POL	0 1	DLRCLK Polarity. Allows the swapping of data between channels. Left/Odd channels are DLRCLK Low (Normal). Left/Odd channels are DLRCLK High (Inverted).	0x0	RW
4	SAI_MSB	0 1	MSB Position. MSB First DSDATA. LSB First DSDATA.	0x0	RW
2	BCLK_RATE	0 1	DBCLK Rate. Number of DBCLK cycles per DLRCLK frame. Used only for generating DBCLK in master mode operation (SAI_MS = 1). 32 Cycles per Frame. 16 Cycles per Frame.	0x0	RW

Bits	Bit Name	Settings	Description	Reset	Access
1	BCLK_EDGE	0 1	DBCLK Active Edge. Adjust the polarity of the DBCLK leading edge. Latch in Rising Edge. Latch in Falling Edge.	0x0	RW
0	SAI_MS	0 1	Serial Interface Master. Both DLRCLK and DBCLK become the master when enabled. DLRCLK/DBCLK Slave. DLRCLK/DBCLK Master.	0x0	RW

DAC CONTROL 2 REGISTER

Address: 0x08, Reset: 0x06, Name: DAC_CTRL2

Table 33. Bit Descriptions for DAC_CTRL2

Bits	Bit Name	Settings	Description	Reset	Access
4	BCLK_TDMC	0 1	DBCLK Rate in TDM Mode. Number of DBCLK cycles per channel slot when in TDM mode. 32 BCLK cycles/channel slot. 16 BCLK cycles/channel slot.	0x0	RW
3	DAC_POL	0 1	DAC Output Polarity. This is a global switch of DAC polarity. Noninverted DAC Output. Inverted DAC Output.	0x0	RW
2	AUTO_MUTE_EN	0 1	Automute Enable. Automatically mutes the DACs when 1024 consecutive zero input samples are received. This is independent per channel. Auto-Zero Input Mute Disabled. Auto-Zero Input Mute Enabled.	0x1	RW
1	DAC_OSR	0 1	DAC Oversampling Rate. OSR selection. 256 × fs DAC Oversampling. 128 × fs DAC Oversampling.	0x1	RW
0	DE_EMP_EN	0 1	De-Emphasis Enable. No De-Emphasis/Flat. De-Emphasis Enabled.	0x0	RW

DAC INDIVIDUAL CHANNEL MUTES 1 REGISTER

Address: 0x09, Reset: 0x00, Name: DAC_MUTE1

Table 34. Bit Descriptions for DAC_MUTE1

Bits	Bit Name	Settings	Description	Reset	Access
7	DAC08_MUTE	0 1	DAC8 Soft Mute DAC8 Normal Operation DAC8 Muted	0x0	RW
6	DAC07_MUTE	0 1	DAC7 Soft Mute DAC7 Normal Operation DAC7 Muted	0x0	RW
5	DAC06_MUTE	0 1	DAC6 Soft Mute DAC6 Normal Operation DAC6 Muted	0x0	RW
4	DAC05_MUTE	0 1	DAC5 Soft Mute DAC5 Normal Operation DAC5 Muted	0x0	RW
3	DAC04_MUTE	0 1	DAC4 Soft Mute DAC4 Normal Operation DAC4 Muted	0x0	RW
2	DAC03_MUTE	0 1	DAC3 Soft Mute DAC3 Normal Operation DAC3 Muted	0x0	RW
1	DAC02_MUTE	0 1	DAC2 Soft Mute DAC2 Normal Operation DAC2 Muted	0x0	RW
0	DAC01_MUTE	0 1	DAC1 Soft Mute DAC1 Normal Operation DAC1 Muted	0x0	RW

DAC INDIVIDUAL CHANNEL MUTES 2 REGISTER

Address: 0x0A, Reset: 0x00, Name: DAC_MUTE2

Table 35. Bit Descriptions for DAC_MUTE2

Bits	Bit Name	Settings	Description	Reset	Access
7	DAC16_MUTE	0 1	DAC16 Soft Mute DAC16 Normal Operation DAC16 Muted	0x0	RW
6	DAC15_MUTE	0 1	DAC15 Soft Mute DAC15 Normal Operation DAC15 Muted	0x0	RW
5	DAC14_MUTE	0 1	DAC14 Soft Mute DAC14 Normal Operation DAC14 Muted	0x0	RW
4	DAC13_MUTE	0 1	DAC13 Soft Mute DAC13 Normal Operation DAC13 Muted	0x0	RW
3	DAC12_MUTE	0 1	DAC12 Soft Mute DAC12 Normal Operation DAC12 Muted	0x0	RW
2	DAC11_MUTE	0 1	DAC11 Soft Mute DAC11 Normal Operation DAC11 Muted	0x0	RW
1	DAC10_MUTE	0 1	DAC10 Soft Mute DAC10 Normal Operation DAC10 Muted	0x0	RW
0	DAC09_MUTE	0 1	DAC9 Soft Mute DAC9 Normal Operation DAC9 Muted	0x0	RW

MASTER VOLUME CONTROL REGISTER

Address: 0x0B, Reset: 0x00, Name: DACMSTR_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

[7:0] DACMSTR_VOL
 Master Volume Control
 00000000: 0 dB (default)
 00000001: -0.375 dB
 00000010: -0.750 dB
 11111110: -95.250 dB
 11111111: -95.625 dB

Table 36. Bit Descriptions for DACMSTR_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DACMSTR_VOL	00000000 00000001 00000010 11111110 11111111	Master Volume Control 0 dB (default) -0.375 dB -0.750 dB -95.250 dB -95.625 dB	0x00	RW

DAC 1 VOLUME CONTROL REGISTER

Address: 0x0C, Reset: 0x00, Name: DAC01_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

[7:0] DAC01_VOL
 DAC Volume Control Channel 1
 00000000: 0 dB (default)
 00000001: -0.375 dB
 00000010: -0.750 dB
 11111110: -95.250 dB
 11111111: -95.625 dB

Table 37. Bit Descriptions for DAC01_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC01_VOL	00000000 00000001 00000010 11111110 11111111	DAC Volume Control Channel 1 0 dB (default) -0.375 dB -0.750 dB -95.250 dB -95.625 dB	0x00	RW

DAC 2 VOLUME CONTROL REGISTER

Address: 0x0D, Reset: 0x00, Name: DAC02_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

Table 38. Bit Descriptions for DAC02_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC02_VOL		DAC Volume Control Channel 2	0x00	RW
		00000000	0 dB (default)		
		00000001	-0.375 dB		
		00000010	-0.750 dB		
		11111110	-95.250 dB		
		11111111	-95.625 dB		

DAC 3 VOLUME CONTROL REGISTER

Address: 0x0E, Reset: 0x00, Name: DAC03_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

Table 39. Bit Descriptions for DAC03_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC03_VOL		DAC Volume Control Channel 3	0x00	RW
		00000000	0 dB (default)		
		00000001	-0.375 dB		
		00000010	-0.750 dB		
		11111110	-95.250 dB		
		11111111	-95.625 dB		

DAC 4 VOLUME CONTROL REGISTER

Address: 0x0F, Reset: 0x00, Name: DAC04_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

Table 40. Bit Descriptions for DAC04_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC04_VOL		DAC Volume Control Channel 4	0x00	RW
		00000000	0 dB (default)		
		00000001	-0.375 dB		
		00000010	-0.750 dB		
		11111110	-95.250 dB		
		11111111	-95.625 dB		

DAC 5 VOLUME CONTROL REGISTER

Address: 0x10, Reset: 0x00, Name: DAC05_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

Table 41. Bit Descriptions for DAC05_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC05_VOL		DAC Volume Control Channel 5	0x00	RW
		00000000	0 dB (default)		
		00000001	-0.375 dB		
		00000010	-0.750 dB		
		11111110	-95.250 dB		
		11111111	-95.625 dB		

DAC 6 VOLUME CONTROL REGISTER

Address: 0x11, Reset: 0x00, Name: DAC06_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

Table 42. Bit Descriptions for DAC06_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC06_VOL	00000000 00000001 00000010 11111110 11111111	DAC Volume Control Channel 6 0 dB (default) -0.375 dB -0.750 dB -95.250 dB -95.625 dB	0x00	RW

DAC 7 VOLUME CONTROL REGISTER

Address: 0x12, Reset: 0x00, Name: DAC07_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

Table 43. Bit Descriptions for DAC07_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC07_VOL	00000000 00000001 00000010 11111110 11111111	DAC Volume Control Channel 7 0 dB (default) -0.375 dB -0.750 dB -95.250 dB -95.625 dB	0x00	RW

DAC 8 VOLUME CONTROL REGISTER

Address: 0x13, Reset: 0x00, Name: DAC08_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

[7:0] DAC08_VOL
DAC Volume Control Channel 8

00000000: 0 dB (default)
00000001: -0.375 dB
00000010: -0.750 dB
11111110: -95.250 dB
11111111: -95.625 dB

Table 44. Bit Descriptions for DAC08_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC08_VOL		DAC Volume Control Channel 8	0x00	RW
		00000000	0 dB (default)		
		00000001	-0.375 dB		
		00000010	-0.750 dB		
		11111110	-95.250 dB		
		11111111	-95.625 dB		

DAC 9 VOLUME CONTROL REGISTER

Address: 0x14, Reset: 0x00, Name: DAC09_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

[7:0] DAC09_VOL
DAC Volume Control Channel 9

00000000: 0 dB (default)
00000001: -0.375 dB
00000010: -0.750 dB
11111110: -95.250 dB
11111111: -95.625 dB

Table 45. Bit Descriptions for DAC09_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC09_VOL		DAC Volume Control Channel 9	0x00	RW
		00000000	0 dB (default)		
		00000001	-0.375 dB		
		00000010	-0.750 dB		
		11111110	-95.250 dB		
		11111111	-95.625 dB		

DAC 10 VOLUME CONTROL REGISTER

Address: 0x15, Reset: 0x00, Name: DAC10_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

Table 46. Bit Descriptions for DAC10_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC10_VOL	00000000 00000001 00000010 11111110 11111111	DAC Volume Control Channel 10 0 dB (default) -0.375 dB -0.750 dB -95.250 dB -95.625 dB	0x00	RW

DAC 11 VOLUME CONTROL REGISTER

Address: 0x16, Reset: 0x00, Name: DAC11_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

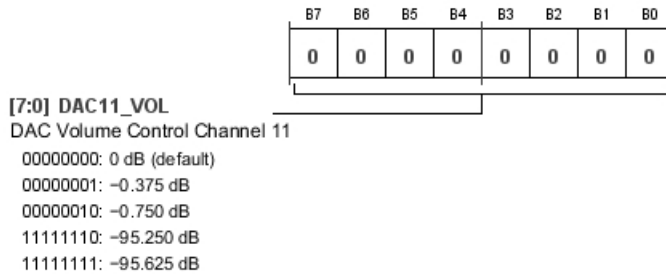

Table 47. Bit Descriptions for DAC11_VOL

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	DAC11_VOL	00000000 00000001 00000010 11111110 11111111	DAC Volume Control Channel 11 0 dB (default) -0.375 dB -0.750 dB -95.250 dB -95.625 dB	0x00	RW

DAC 12 VOLUME CONTROL REGISTER

Address: 0x17, Reset: 0x00, Name: DAC12_VOL

Each 1-bit step corresponds to a 0.375 dB change in volume. See Table 58 for a complete list of the volume settings.

[7:0] DAC12_VOL
 DAC Volume Control Channel 12
 00000000: 0 dB (default)
 00000001: -0.375 dB
 00000010: -0.750 dB
 11111110: -95.250 dB
 11111111: -95.625 dB

OUTLINE DIMENSIONS

COMPLIANT TO JEDEC STANDARDS MS-026-BEC
 Figure 24. 80-Lead Low Profile Quad Flat Package [LQFP] (ST-80-2)
 Dimensions shown in millimeters

081706-A

ORDERING GUIDE

Model ^{1,2}	Temperature Range	Package Description	Package Option
ADAU1966AWBSTZ	-40°C to +105°C	80-Lead LQFP	ST-80-2
ADAU1966AWBSTZ-RL	-40°C to +105°C	80-Lead LQFP, 13" Tape and Reel	ST-80-2
EVAL-ADAU1966AZ		Evaluation Board	

¹ Z = RoHS Compliant Part.
² W = Qualified for Automotive Applications.

AUTOMOTIVE PRODUCTS

The ADAU1966AW models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.

NOTES

I²C refers to a communications protocol originally developed by Philips Semiconductors (now NXP Semiconductors).
