- Hermetic packages
- ESCC qualified
- Up to 100 krad(Si) low dose rate

Description

The 2N3700HR is a NPN transistor specifically designed for aerospace and Hi-Rel applications. It is available in the JAN qualification system (MIL-PRF19500) and in the ESCC qualification system (ESCC 5000). In case of discrepancies between this datasheet and the relevant agency specification, the latter takes precedence.

1. This parameter may be determined by applying an rf signal voltage of 1.0 volt (rms) across the collector-base terminals, and measuring the ac voltage drop (V_{eb}) with a high-impedance rf voltmeter across the emitter-base terminals. With $f = 79.8 \text{ MHz}$ used for the 1.0 volt signal, the following computation applies:
 $r'b, C_c(\text{ps}) = 2 \times V_{eb} (\text{mV})$.

3 Radiation hardness assurance

The products guaranteed in radiation within the JANS system fully comply with the MIL-PRF-19500/255 specification.

The products guaranteed in radiation within the ESCC system fully comply with the ESCC 5201/004 and ESCC 22900 specifications.

JANS radiation assurance

ST JANS parts guaranteed at 100 krad (Si), tested, in full compliancy with the MIL-PRF-19500 specification, specifically the Group D, subgroup 2 inspection, between 50 and 300 rad/s. A brief summary is provided below:

- All test are performed in accordance to MIL-PRF-19500 and test method 1019 of MIL-STD-750 for total Ionizing dose.
- Each wafer of each lot is tested. The table below provides for each monitored parameters of the test conditions and the acceptance criteria.

Table 6. MIL-PRF-19500 (test method 1019) post radiation electrical characteristics

		$I_C = 0.1$ mA $V_{CE} = 10$ V	$[25]^{(1)}$		200	
		$I_C = 10$ mA $V_{CE} = 10$ V	$[45]^{(1)}$			
		$I_C = 500$ mA $V_{CE} = 10$ V	$[25]^{(1)}$		200	
		$I_C = 1.0$ A $V_{CE} = 10$ V	$[7.5]^{(1)}$			

1. See method 1019 of MIL-STD-750 for how to determine $[h_{FE}]$ by first calculating the delta ($1/h_{FE}$) from the pre- and post-radiation h_{FE} . Notice the $[h_{FE}]$ is not the same as h_{FE} and cannot be measured directly. The $[h_{FE}]$ value can never exceed the pre-radiation minimum h_{FE} that it is based upon.

ESCC radiation assurance

Each product lot is tested according to the ESCC basic specification 22900, with a minimum of 11 samples per diffusion lot and 5 samples per wafer, one sample being kept as unirradiated sample, all of them being fully compliant with the applicable ESCC generic and/or detailed specification.

ST goes beyond the ESCC specification by performing the following procedure:

- Test of 11 pieces by wafer, 5 biased at least 80% of $V_{(BR)CEO}$, 5 unbiased and 1 kept for reference
- Irradiation at 0.1 rad (Si)/s
- Acceptance criteria of each individual wafer if as 100 krad guaranteed if all 10 samples comply with the post radiation electrical characteristics provided in Table XX???
- Delivery together with the parts of the radiation verification test (RVT) report of the particular wafer used to manufacture the products. This RVT includes the value of each parameter at 30, 50, 70 and 100 krad (Si) and after 24 hour annealing at room temperature and after an additional 168 hour annealing at 100°C.
